

16-Ch/Dual 8-Ch High-Performance CMOS Analog Multiplexers

FEATURES

- Low On-Resistance— $r_{DS(on)}$: 45 Ω
- Low Charge Injection—Q: 11 pC
- Fast Transition Time— t_{TRANS} : 115 ns
- Low Power: 0.2 mW
- Single Supply Capability

BENEFITS

- Higher Accuracy
- Reduced Glitching
- Improved Data Throughput
- Reduced Power Consumption
- Increased Ruggedness
- Wide Supply Ranges: ± 5 V to ± 20 V

APPLICATIONS

- Data Acquisition Systems
- Audio Signal Routing
- Medical Instrumentation
- ATE Systems
- Battery Powered Systems
- High-Rel Systems
- Single Supply Systems

DESCRIPTION

The DG406B is a 16-channel single-ended analog multiplexer designed to connect one of sixteen inputs to a common output as determined by a 4-bit binary address. The DG407B selects one of eight differential inputs to a common differential output. Break-before-make switching action protects against momentary shorting of inputs.

An on channel conducts current equally well in both directions. In the off state each channel blocks voltages up to the power supply rails. An enable (EN) function allows the user to reset the multiplexer/demultiplexer to all switches off for stacking several devices. All control inputs, address (A_x) and enable (EN) are TTL compatible over the full specified operating temperature range.

Applications for the DG406B/407B include high speed data acquisition, audio signal switching and routing, ATE systems, and avionics. High performance and low power dissipation make them ideal for battery operated and remote instrumentation applications.

Designed in the 44-V silicon-gate CMOS process, the absolute maximum voltage rating is extended to 44 volts, allowing operation with ± 20 -V supplies. Additionally single (12-V) supply operation is allowed. An epitaxial layer prevents latchup.

Notes:

- Guaranteed by $\pm 15\text{-V}$ leakage test, not production tested.
- Room = 25°C, Full = as determined by the operating temperature suffix.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
- Guaranteed by design, not subject to production test.
- V_{IN} = input voltage to perform proper function.
- $\Delta r_{DS(on)} = r_{DS(on)} \text{ MAX} - r_{DS(on)} \text{ MIN}$.
- Worst case isolation occurs on Channel 4 due to proximity to the drain pin.
