

PRELIMINARY
MX27C4111

**4M-BIT [512K x8/256K x16] CMOS EPROM
WITH PAGE MODE**

FEATURES

- With Page Mode function, 8-word/16-byte page
- 512K x 8 or 256K x 16 organization
- +12.5V programming voltage
- Fast access time: 90/100/120/150 ns
- Page mode access time 50/60/75 ns
- Totally static operation
- Completely TTL compatible
- Operating current: 60mA
- Standby current: 100uA
- Package type:
 - 40 pin plastic DIP
 - 40 pin SOP

GENERAL DESCRIPTION

The MX27C4111 is a 4M-bit, One Time Programmable Read Only Memory with page mode. It is organized as 512K x 8 or 256K x 16, operates from a single + 5 volt supply, has a static standby mode, and features fast single address location programming. All programming signals are TTL levels, requiring a single pulse. For programming outside from the system, existing EPROM programmers may be used. The MX27C4111 supports a intelligent fast programming algorithm which can result in programming time of less than two minutes.

MX27C4111 provides Page Read Access Mode which can greatly reduce the read access time. Normal read access time and Page Mode read access time is as fast as 90/50ns. It is designed to be compatible with all microprocessors and similar applications in which high performance, large bit storage and simple interfacing are important design considerations.

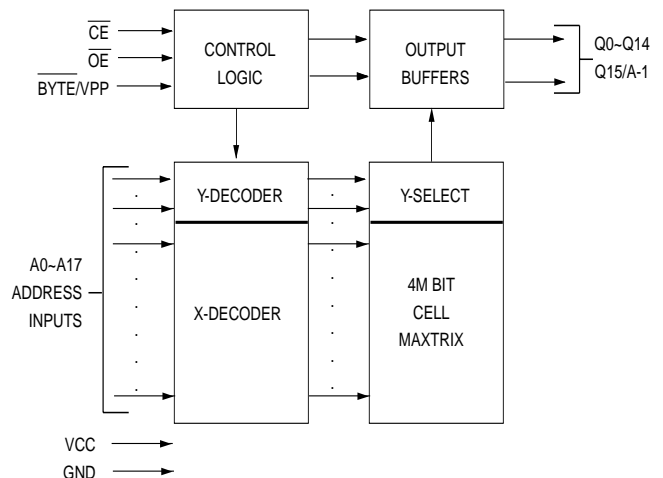

This EPROM is packaged in industry standard 40 pin dual-in-line packages and 40 pin SOP packages.

PIN CONFIGURATIONS

PDIP/SOP

BLOCK DIAGRAM

PIN DESCRIPTION

SYMBOL	PIN NAME
A0~A17	Address Input
Q0~Q14	Data Input/Output
\overline{CE}	Chip Enable Input
\overline{OE}	Output Enable Input
$\overline{BYTE/VPP}$	Word/Byte Selection/Program Supply Voltage
Q15/A-1	Q15(Word mode)/LSB addr. (Byte mode)
VCC	Power Supply Pin (+5V)
GND	Ground Pin

TRUTH TABLE OF \overline{BYTE} FUNCTION **\overline{BYTE} MODE($\overline{BYTE} = \text{GND}$)**

\overline{CE}	\overline{OE}	Q15/A-1	MODE	Q0-Q7	SUPPLY CURRENT
H	X	X	Non selected	High Z	Standby(ICC2)
L	H	X	Non selected	High Z	Operating(ICC1)
L	L	A-1 input	Selected	DOUT	Operating(ICC1)

WORD MODE($\overline{BYTE} = \text{VCC}$)

\overline{CE}	\overline{OE}	Q15/A-1	MODE	Q0-Q14	SUPPLY CURRENT
H	X	High Z	Non selected	High Z	Standby(ICC2)
L	H	High Z	Non selected	High Z	Operating(ICC1)
L	L	DOUT	Selected	DOUT	Operating(ICC1)

NOTE : X = H or L

FUNCTIONAL DESCRIPTION

THE PROGRAMMING OF THE MX27C4111

When the MX27C4111 is delivered, or it is erased, the chip has all 4M bits in the "ONE" or HIGH state. "ZEROs" are loaded into the MX27C4111 through the procedure of programming.

For programming, the data to be programmed is applied with 16 bits in parallel to the data pins.

VCC must be applied simultaneously or before VPP, and removed simultaneously or after VPP. When programming an MXIC EPROM, a 0.1uF capacitor is required across VPP and ground to suppress spurious voltage transients which may damage the device.

FAST PROGRAMMING

The device is set up in the fast programming mode when the programming voltage $VPP = 12.75V$ is applied, with $VCC = 6.25 V$ and $OE = VIH$ (Algorithm is shown in Figure 1). The programming is achieved by applying a single TTL low level 100us pulse to the CE input after addresses and data line are stable. If the data is not verified, an additional pulse is applied for a maximum of 25 pulses. This process is repeated while sequencing through each address of the device. When the programming mode is completed, the data in all address is verified at $VCC = VPP = 5V \pm 10\%$.

PROGRAM INHIBIT MODE

Programming of multiple MX27C4111's in parallel with different data is also easily accomplished by using the Program Inhibit Mode. Except for CE and OE, all like inputs of the parallel MX27C4111 may be common. A TTL low-level program pulse applied to an MX27C4111 CE input with $VPP = 12.5 \pm 0.5 V$ will program the MX27C4111. A high-level CE input inhibits the other MX27C4111s from being programmed.

PROGRAM VERIFY MODE

Verification should be performed on the programmed bits to determine that they were correctly programmed. The verification should be performed with OE at VIL, CE at VIH, and VPP at its programming voltage.

AUTO IDENTIFY MODE

The auto identify mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and device type. This mode is intended for use by programming equipment for the purpose of automatically matching the device to be programmed with its corresponding programming algorithm. This mode is functional in the $25^{\circ}C \pm 5^{\circ}C$ ambient temperature range that is required when programming the MX27C4111.

To activate this mode, the programming equipment must force $12.0 \pm 0.5 V$ on address line A9 of the device. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from VIL to VIH. All other address lines must be held at VIL during auto identify mode.

Byte 0 (A0 = VIL) represents the manufacturer code, and byte 1 (A0 = VIH), the device identifier code. For the MX27C4111, these two identifier bytes are given in the Mode Select Table. All identifiers for manufacturer and device codes will possess odd parity, with the MSB (Q15) defined as the parity bit.

READ MODE

The MX27C4111 provides page mode with 8 words/16 bytes per page. In order to get the benefit of fast page read, the user should keep chip enable (CE) low and toggle address A0~A2 in word mode or A-1~A2 in byte mode. Page Read access time (tPA) is equal to the delay from address stable to data output. It is twice as fast as normal tACC and is highly recommended.

WORD-WIDE MODE

With \overline{BYTE}/VPP at $VCC \pm 0.2V$ outputs Q0-7 present data Q0-7 and outputs Q8-15 present data Q8-15, after CE and OE are appropriately enabled.

BYTE-WIDE MODE

With \overline{BYTE}/VPP at $GND \pm 0.2V$, outputs Q8-15 are tri-stated. If Q15/A-1 = VIH, outputs Q0-7 present data bits Q8-15. If Q15/A-1 = VIL, outputs Q0-7 present data bits Q0-7.

STANDBY MODE

The MX27C4111 has a CMOS standby mode which reduces the maximum VCC current to 100 μ A. It is placed in CMOS standby when CE is at VCC \pm 0.3 V. The MX27C4111 also has a TTL-standby mode which reduces the maximum VCC current to 1.5 mA. It is placed in TTL-standby when $\overline{\text{CE}}$ is at VIH. When in standby mode, the outputs are in a high-impedance state, independent of the $\overline{\text{OE}}$ input.

TWO-LINE OUTPUT CONTROL FUNCTION

To accommodate multiple memory connections, a two-line control function is provided to allow for:

1. Low memory power dissipation,
2. Assurance that output bus contention will not occur.

It is recommended that $\overline{\text{CE}}$ be decoded and used as the primary device-selecting function, while $\overline{\text{OE}}$ be made a common connection to all devices in the array and

connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low-power standby mode and that the output pins are only active when data is desired from a particular memory device.

SYSTEM CONSIDERATIONS

During the switch between active and standby conditions, transient current peaks are produced on the rising and falling edges of Chip Enable. The magnitude of these transient current peaks is dependent on the output capacitance loading of the device. At a minimum, a 0.1 μ F ceramic capacitor (high frequency, low inherent inductance) should be used on each device between Vcc and GND to minimize transient effects. In addition, to overcome the voltage drop caused by the inductive effects of the printed circuit board traces on EPROM arrays, a 4.7 μ F bulk electrolytic capacitor should be used between VCC and GND for each eight devices. The location of the capacitor should be close to where the power supply is connected to the array.

MODE SELECT TABLE

MODE	$\overline{\text{CE}}$	$\overline{\text{OE}}$	A9	A0	Q15/A-1	BYTE/		
						VPP(5)	Q8-14	Q0-7
Read (Word)	VIL	VIL	X	X	Q15 Out	VCC	Q8-14 Out	Q0-7 Out
Read (Upper Byte)	VIL	VIL	X	X	VIH	GND	High Z	Q8-15 Out
Read (Lower Byte)	VIL	VIL	X	X	VIL	GND	High Z	Q0-7 Out
Output Disable	VIL	VIH	X	X	High Z	X	High Z	High Z
Standby	VIH	X	X	X	High Z	X	High Z	High Z
Program	VIL	VIH	X	X	Q15 In	VPP	Q8-14 In	Q0-7 In
Program Verify	VIH	VIL	X	X	Q5 Out	VPP	Q8-14 Out	Q0-7 Out
Program Inhibit	VIH	VIH	X	X	High Z	VPP	High Z	High Z
Manufacturer Code(3)	VIL	VIL	VH	VIL	0B	VCC	00H	C2H
Device Code(3)	VIL	VIL	VH	VIH	1B	VCC	38H	00H

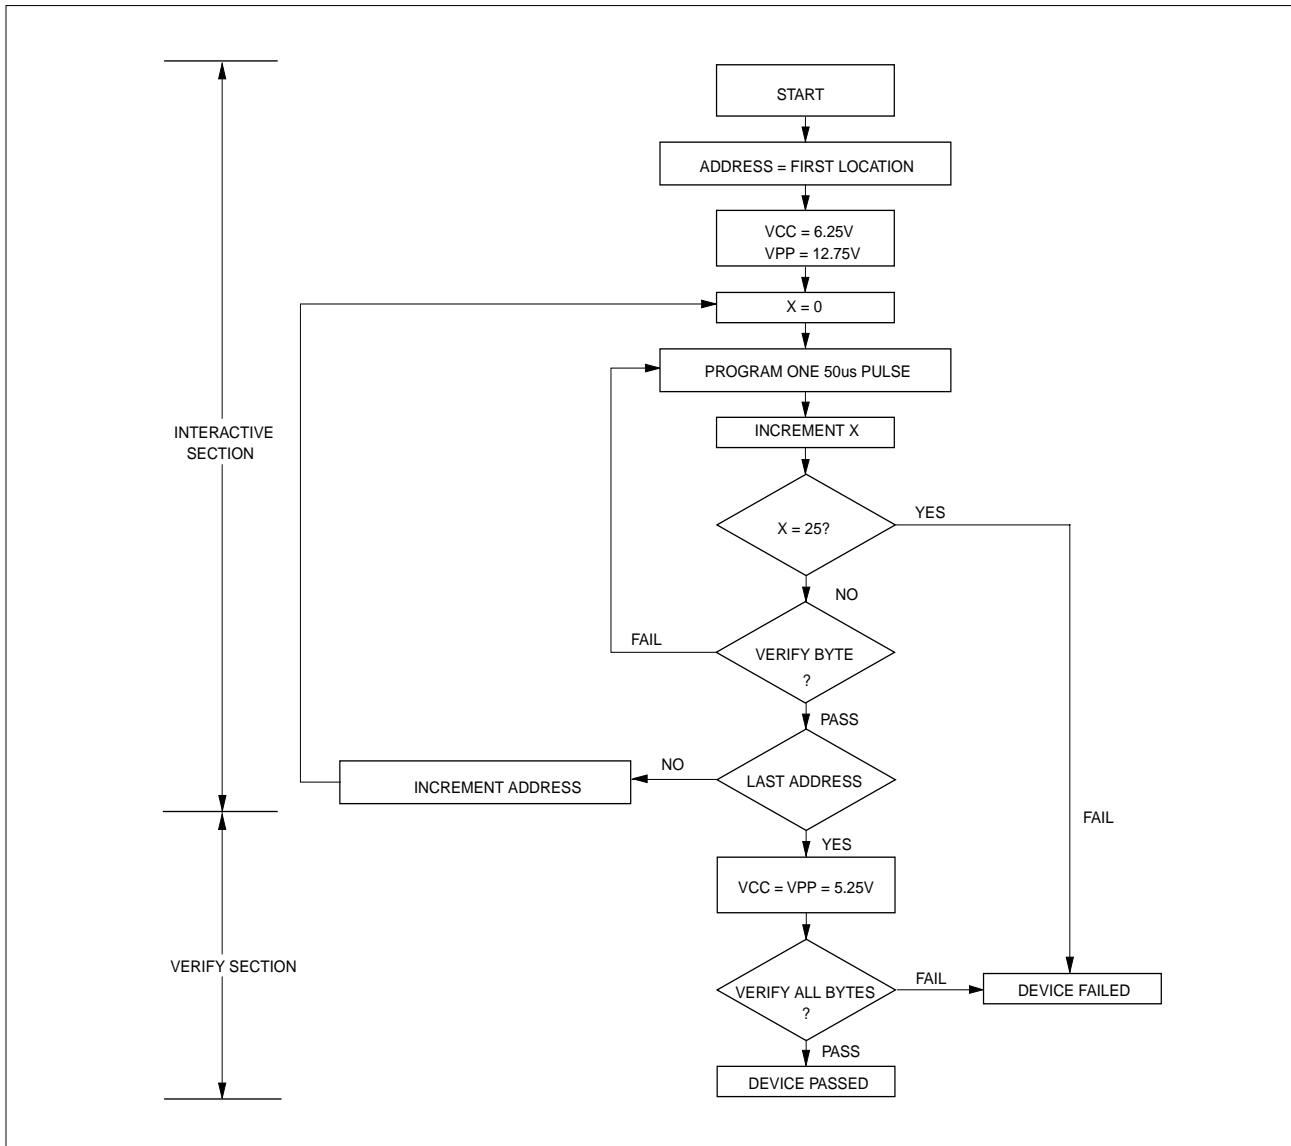

NOTES:

1. VH = 12.0V \pm 0.5V
2. X = Either VIH or VIL
3. A1 - A8, A10 - A17 = VIL (For auto select)
4. See DC Programming Characteristics for VPP voltages.

5. $\overline{\text{BYTE/VPP}}$ is intended for operation under DC Voltage conditions only.

6. Manufacture code = 00C2H
Device code = B800H

ABSOLUTE MAXIMUM RATINGS

RATING	VALUE
Ambient Operating Temperature	0°C to 70°C
Storage Temperature	-65°C to 125°C
Applied Input Voltage	-0.5V to 7.0V
Applied Output Voltage	-0.5V to VCC + 0.5V
VCC to Ground Potential	-0.5V to 7.0V
A9 & VPP	-0.5V to 13.5V

NOTICE:

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.

NOTICE:

Specifications contained within the following tables are subject to change.
