

Features

- 80 MHz -3 dB bandwidth for gains of 1 to 10
- 900 V/ μ s slew rate
- 10 MHz bandwidth flat to 0.1 dB
- Excellent differential gain and phase
- TTL/CMOS compatible
- Available in SOL-16

Applications

- RGB drivers
- RGB multiplexers
- RGB gain blocks
- Video gain blocks
- Coax cable driver
- ADC drivers/input multiplexer

General Description

The EL4393C is three wideband current-feedback amplifiers optimized for video performance. Each amplifier can drive a load of 150Ω at video levels. Each amplifier has a disable capability, which is controlled by a TTL/CMOS compatible logic signal. The EL4393C operates on supplies as low as $\pm 4\text{V}$ up to $\pm 15\text{V}$.

Being a current-feedback design, the bandwidth stays relatively constant at approximately 80 MHz over the ± 1 to ± 10 gain range. The EL4393C has been optimized for use with 1300Ω feedback resistors at a gain of 2.

When the outputs are disabled, the supply current consumption drops, by about 4 mA per channel that is disabled. This feature can be used to reduce power dissipation.

Current into V_{IN}^+ or V_{IN}^-	5 mA		

Important Note:

All parameters having Min/Max specifications are guaranteed. The Test Level column indicates the specific device testing actually performed during production and Quality inspection. Elantec performs most electrical tests using modern high-speed automatic test equipment, specifically the LTX77 Series system. Unless otherwise noted, all tests are pulsed tests, therefore $T_J = T_C = T_A$.

Test Level	Test Procedure
I	100% production tested and QA sample tested per QA test plan QCX0002.
II	100% production tested at $T_A = 25^\circ\text{C}$ and QA sample tested at $T_A = 25^\circ\text{C}$, T_{MAX} and T_{MIN} per QA test plan QCX0002.
III	QA sample tested per QA test plan QCX0002.
IV	Parameter is guaranteed (but not tested) by Design and Characterization Data.
V	Parameter is typical value at $T_A = 25^\circ\text{C}$ for information purposes only.

Note 1: $V_{CM} = \pm 10\text{V}$ for $V_S = \pm 15\text{V}$.

Note 2: V_{OS} is measured at $V_S = \pm 4.5\text{V}$ and $V_S = \pm 16\text{V}$, both supplies are changed simultaneously.

Note 3: Only one output short circuited. Pulse test or use heatsink.

Closed Loop AC Electrical Characteristics Supplies at $\pm 15\text{V}$, Load = 150Ω and 15pF , except where noted. R_{f1} and $R_{f2} = 1500\Omega$; $A_V = 2$, $T_A = 25^\circ\text{C}$. (See note 8 re: test fixture)

			0.096		V	(°)

Note 4: $R_L = 300\Omega$, -5V to +5V swing, SR measured at 20% to 80%.

Note 5: -2V to +2V swing, SR measured at 20% to 80%.

Note 6: $R_L = 300\Omega$.

Note 7: DC offset from -0.7V through +0.7V AC amplitude is 286mV_{P-P} , equivalent to 40 μV .

Note 8: Test fixture was designed to minimize capacitance at the I_N^+ input. A "good" fixture should have less than 2 pF of stray capacitance to ground at this very sensitive pin. See application notes for further details.

Typical Application for EL4393, and General Rules for PCB

Layout

The figure shows two EL4393's configured as a 2:1 RGB multiplexer, and cable driver, driving 75 Ω , back terminated cables. Each channel of the EL4393 is configured to give a gain of two, to make up for the losses of the back terminating resistor.

In this example, the Disable pins of each RGB section are driven by a complementary TTL "select" signal. Larger multiplexers can be assembled, with a 1-of-n TTL decoder selecting each RGB triplet.

The circuit gives channel isolations of typically better than -50 dB at 10 MHz, and with a 20 dB/decade slope, extending down to better than -90 dB at frequencies below 100 kHz.

The schematic does not show things like power supply decoupling, or pcb layout, grounding and signal returns, but these will all affect the overall performance of the circuit, and care should be taken with these aspects.

It is recommended that the V_{CC} and V_{EE} pins each be decoupled by a 0.1 μ F NPO or X7R dielectric ceramic capacitors to ground within 0.1 inch of the part, and in parallel with the 0.1 μ F, A 47 μ F tantalum capacitor, also to ground. The 47 μ F capacitors should be within 0.25 inch of their power pins. The ground plane should be underneath the package, but cut away from the In- inputs. Care should be taken with the center channel feedback—it must be kept away from any of the in+ or in- pins, if it has to go under the package. Route the G-out line between the pin 3 ground and the pin 4 In- if going under the package is essential. Otherwise, loop the G-out trace around all the other circuitry, to its Rf resistor. The Rf and if used, Rg resistors should be on the input side of the package, to minimize trace length on the In- pins.

The digital input disables are on the output side of the package, so that a good ground plane down the center of the board underneath the package will isolate any fast edges from the sensitive inputs.
