18874368-BIT(524288-WORD BY 36-BIT) NETWORK SRAM

DESCRIPTION

The M5M5V5636GP is a family of 18M bit synchronous SRAMs organized as 524288-words by 36-bit. It is designed to eliminate dead bus cycles when turning the bus around between reads and writes, or writes and reads. Renesas's SRAMs are fabricated with high performance, low power CMOS technology, providing greater reliability. M5M5V5636GP operates on 3.3V power/ 2.5V I/O supply or a single 3.3V power supply and are 3.3V CMOS compatible.

The M5M5V5636GP also operates on a single 2.5V power supply and is also 2.5V CMOS compatible. Therefore the M5M5V5636GP can replace the M5M5T5636GP.

The M5M5V5636GP-16 operates at 167MHz or 133MHz and is guaranteed both AC DC electrical characteristics of 167MHz and those of 133MHz.

FEATURES

- Fully registered inputs and outputs for pipelined operation
- Fast clock speed: 167 MHz and 133MHz
- Fast access time: 3.8 ns and 4.2ns
- Single 3.3V -5% and +5% power supply V_{DD}
- Separate V_{DDQ} for 3.3V or 2.5V I/O
- Single 2.5V -5% and +5% power supply V_{DD}
- Individual byte write (BWA# - BWD#) controls may be tied LOW
- Single Read/Write control pin (W#)
- CKE# pin to enable clock and suspend operations
- Internally self-timed, registers outputs eliminate the need to control G#
- Snooze mode (ZZ) for power down
- Linear or Interleaved Burst Modes
- Three chip enables for simple depth expansion

167MHz	3.8ns	6.0ns	380mA	30mA
133MHz	4.2ns	7.5ns	350mA	30mA

PACKAGE

100pin TQFP

APPLICATION

High-end networking products that require high bandwidth, such as switches and routers.

FUNCTION

Synchronous circuitry allows for precise cycle control triggered by a positive edge clock transition.

Synchronous signals include : all Addresses, all Data Inputs, all Chip Enables (E1#, E2, E3#), Address Advance/Load (ADV), Clock Enable (CKE#), Byte Write Enables (BWA#, BWb#, BWc#, BWD#) and Read/Write (W#). Write operations are controlled by the four Byte Write Enables (BWA# - BWD#) and Read/Write(W#) inputs. All writes are conducted with on-chip synchronous self-timed write circuitry.

Asynchronous inputs include Output Enable (G#), Clock (CLK) and Snooze Enable (ZZ). The HIGH input of ZZ pin puts the SRAM in the power-down state. The Linear Burst order (LBO#) is DC operated pin. LBO# pin will allow the choice of either an interleaved burst, or a linear burst.

All read, write and deselect cycles are initiated by the ADV LOW input. Subsequent burst address can be internally generated as controlled by the ADV HIGH input.

PIN FUNCTION

Pin	Name	Function
A0~A18	Synchronous Address Inputs	These inputs are registered and must meet the setup and hold times around the rising edge of CLK. A0 and A1 are the two least significant bits (LSB) of the address field and set the internal burst counter if burst is desired.
BWa#, BWb#, BWc#, BWd#	Synchronous Byte Write Enables	These active LOW inputs allow individual bytes to be written when a WRITE cycle is active and must meet the setup and hold times around the rising edge of CLK. BYTE WRITES need to be asserted on the same cycle as the address. BWs are associated with addresses and apply to subsequent data. BWa# controls DQa, DQPa pins; BWb# controls DQb, DQPb pins; BWc# controls DQc, DQPC pins; BWd# controls DQd, DQPD pins.
CLK	Clock Input	This signal registers the address, data, chip enables, byte write enables and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock's rising edge.
E1#	Synchronous Chip Enable	This active LOW input is used to enable the device and is sampled only when a new external address is loaded (ADV is LOW).
E2	Synchronous Chip Enable	This active High input is used to enable the device and is sampled only when a new external address is loaded (ADV is LOW). This input can be used for memory depth expansion.
E3#	Synchronous Chip Enable	This active Low input is used to enable the device and is sampled only when a new external address is loaded (ADV is LOW). This input can be used for memory depth expansion.
G#	Output Enable	This active LOW asynchronous input enable the data I/O output drivers.
ADV	Synchronous Address Advance/Load	When HIGH, this input is used to advance the internal burst counter, controlling burst access after the external address is loaded. When HIGH, W# is ignored. A LOW on this pin permits a new address to be loaded at CLK rising edge.
CKE#	Synchronous Clock Enable	This active LOW input permits CLK to propagate throughout the device. When HIGH, the device ignores the CLK input and effectively internally extends the previous CLK cycle. This input must meet setup and hold times around the rising edge of CLK.
ZZ	Snooze Enable	This active HIGH asynchronous input causes the device to enter a low-power standby mode in which all data in the memory array is retained. When active, all other inputs are ignored. When this pin is LOW or NC, the SRAM normally operates.
W#	Synchronous Read/Write	This active input determines the cycle type when ADV is LOW. This is the only means for determining READs and WRITEs. READ cycles may not be converted into WRITEs (and vice versa) other than by loading a new address. A LOW on the pin permits BYTE WRITE operations and must meet the setup and hold times around the rising edge of CLK. Full bus width WRITEs occur if all byte write enables are LOW.
DQa,DQPa,DQb,DQPb DQc,DQPC,DQd,DQPD	Synchronous Data I/O	Byte "a" is DQa , DQPa pins; Byte "b" is DQb, DQPb pins; Byte "c" is DQc, DQPC pins; Byte "d" is DQd,DQPD pins. Input data must meet setup and hold times around CLK rising edge.
LBO#	Burst Mode Control	This DC operated pin allows the choice of either an interleaved burst or a linear burst. If this pin is HIGH or NC, an interleaved burst occurs. When this pin is LOW, a linear burst occurs, and input leak current to this pin.
VDD	VDD	Core Power Supply
VSS	VSS	Core Ground
VDDQ	VDDQ	I/O buffer Power supply
VSSQ	VSSQ	I/O buffer Ground
MCH	Must Connect High	These pins should be connected to HIGH
NC	No Connect	These pins are not internally connected and may be connected to ground.

DC OPERATED TRUTH TABLE

Name	Input Status	Operation
LBO#	HIGH or NC	Interleaved Burst Sequence
	LOW	Linear Burst Sequence

Note4. LBO# is DC operated pin.

Note5. NC means No Connection.

Note6. See BURST SEQUENCE TABLE about interleaved and Linear Burst Sequence.

BURST SEQUENCE TABLE

Interleaved Burst Sequence (when LBO# = HIGH or NC)

Operation	A18~A2	A1,A0			
First access, latch external address	A18~A2	0, 0	0, 1	1, 0	1, 1
Second access(first burst address)	latched A18~A2	0, 1	0, 0	1, 1	1, 0
Third access(second burst address)	latched A18~A2	1, 0	1, 1	0, 0	0, 1
Fourth access(third burst address)	latched A18~A2	1, 1	1, 0	0, 1	0, 0

Linear Burst Sequence (when LBO# = LOW)

Operation	A18~A2	A1,A0			
First access, latch external address	A18~A2	0, 0	0, 1	1, 0	1, 1
Second access(first burst address)	latched A18~A2	0, 1	1, 0	1, 1	0, 0
Third access(second burst address)	latched A18~A2	1, 0	1, 1	0, 0	0, 1
Fourth access(third burst address)	latched A18~A2	1, 1	0, 0	0, 1	1, 0

Note7. The burst sequence wraps around to its initial state upon completion.

Fig.3 Tri-State measurement

Note21.Valid Delay Measurement is made from the V_{DDQ}/2 on the input waveform to the V_{DDQ}/2 on the output waveform.

Input waveform should have a slew rate of faster than or equal to 1V/ns.

Note22.Tri-state t_{off} measurement is made from the V_{DDQ}/2 on the input waveform to the output waveform moving 20% from its initial to final Value V_{DDQ}/2.

Note:the initial value is not V_{OL} or V_{OH} as specified in DC ELECTRICAL CHARACTERISTICS table.

Note23. Tri-state t_{on} measurement is made from the V_{DDQ}/2 on the input waveform to the output waveform moving 20% from its initial Value V_{DDQ}/2 to its final Value.

Note:the final value is not V_{OL} or V_{OH} as specified in DC ELECTRICAL CHARACTERISTICS table.

Note24.Clocks,Data,Address and control signals will be tested with a minimum input slew rate of faster than or equal to 1V/ns.

Keep safety first in your circuit designs!

- Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
- Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein. The information described here may contain technical inaccuracies or typographical errors.
- Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors. Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).
- When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
 - Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.
