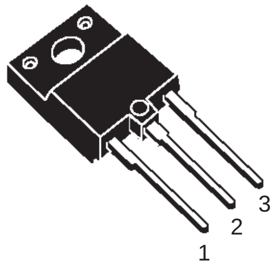
BUH615D

HIGH VOLTAGE FAST-SWITCHING NPN POWER TRANSISTOR

- STMicroelectronics PREFERRED SALESTYPE
- HIGH VOLTAGE CAPABILITY
- NPN TRANSISTOR WITH INTEGRATED FREEWHEELING DIODE
- U.L. RECOGNISED ISOWATT218 PACKAGE (U.L. FILE # E81734 (N))



ISOWATT218

APPLICATIONS:

- HORIZONTAL DEFLECTION FOR COLOUR TV

DESCRIPTION

The BUH615D is manufactured using Multiepitaxial Mesa technology for cost-effective high performance and uses a Hollow Emitter structure to enhance switching speeds.

The BUH series is designed for use in horizontal deflection circuits in televisions and monitors.

BASE DRIVE INFORMATION

A fundamental parameter of high voltage power transistors like those used in the horizontal deflection stage is their junction temperature T_j, which, in turn, depends on the power dissipation. This parameter turns out to influence the system reliability under normal operation. Based on that, STMicroelectronics has introduced a new dynamic, application-oriented characterization differing from the traditional data given in most datasheets.

In order to saturate the power switch and reduce conduction losses, adequate direct base current I_{B1} has to be provided for the lowest gain h_{FE} at T_j = 100 °C (line scan phase). On the other hand, negative base current I_{B2} must be provided for the transistor to be turned off (retrace phase). Most of the dissipation, especially in the deflection application, occurs at switch-off so it is essential to determine the value of I_{B2} which minimizes power losses, fall time t_f and, consequently, T_j. A new set of curves have been defined to give total power losses, t_s and t_f as a function of I_{B2} at both 16 KHz and 32 KHz scanning frequencies for choosing the optimum negative drive. The test circuit is illustrated in fig. 1.

Inductance L_1 serves to control the slope of the negative base current I_{B2} in order that excess carriers in the collector recombine when base current is still present, thus avoiding any tailing phenomenon in the collector current. This effect is, in any case, markedly reduced intrinsically by adopting the hollow emitter technology.

The values of L and C are calculated from the following equations:

$$\frac{1}{2} L\,(I_C)^2 = \frac{1}{2} C\,(V_{CEfly})^2$$

$$\omega = 2\,\pi f = \frac{1}{\sqrt{L\,C}}$$

Where I_C= operating collector current, V_{CEfly}= flyback voltage, f= frequency of oscillation during retrace.
