

360mW MONO AMPLIFIER WITH STANDBY MODE

- **OPERATING FROM $V_{CC}=2V$ to 5.5V**
- **STANDBY MODE ACTIVE HIGH** (TS419) or LOW (TS421)
- **OUTPUT POWER** into 16 Ω : 367mW @ 5V with 10% THD+N max or 295mW @5V and 110mW @3.3V with 1% THD+N max.
- **LOW CURRENT CONSUMPTION**: 2.5mA max
- High Signal-to-Noise ratio: 95dB(A) at 5V
- PSRR: 56dB typ. at 1kHz, 46dB at 217Hz
- **SHORT CIRCUIT LIMITATION**
- ON/OFF click reduction circuitry
- Available in SO8, MiniSO8 & DFN 3x3

DESCRIPTION

The TS419/TS421 is a monaural audio power amplifier driving in BTL mode a 16 or 32 Ω earpiece or receiver speaker. The main advantage of this configuration is to get rid of bulky output capacitors. Capable of descending to low voltages, it delivers up to 220mW per channel (into 16 Ω loads) of continuous average power with 0.2% THD+N in the audio bandwidth from a 5V power supply. An externally controlled standby mode reduces the supply current to 10nA (typ.). The TS419/TS421 can be configured by external gain-setting resistors or used in a fixed gain version.

APPLICATIONS

- 16/32 ohms earpiece or receiver speaker driver
- Mobile and cordless phones (analog / digital)
- PDAs & computers
- Portable appliances

ORDER CODE

Part Number	Temp. Range: I	Package			Gain	Marking
		D	S	Q		
TS419	-40, +85°C	•			external	TS419I
TS421		•			external	TS421I
TS419			•	•	external	K19A
TS419-2			tba	tba	x2/6dB	K19B
TS419-4			tba	tba	x4/12dB	K19C
TS419-8			tba	tba	x8/18dB	K19D
TS421			•	•	external	K21A

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage ¹⁾	6	V
V_i	Input Voltage	-0.3V to $V_{CC}+0.3V$	V
T_{stg}	Storage Temperature	-65 to +150	°C
T_j	Maximum Junction Temperature	150	°C
R_{thja}	Thermal Resistance Junction to Ambient SO8 MiniSO8 DFN8	175 215 70	°C/W
P_d	Power Dissipation ²⁾ SO8 MiniSO8 DFN8	0.71 0.58 1.79	W
ESD	Human Body Model (pin to pin): TS419 ³⁾ , TS421	1.5	kV
ESD	Machine Model - 220pF - 240pF (pin to pin)	100	V
Latch-up	Latch-up Immunity (All pins)	200	mA
	Lead Temperature (soldering, 10sec)	250	°C
	Output Short-Circuit to Vcc or GND	continuous ⁴⁾	

1. All voltage values are measured with respect to the ground pin.

2. P_d has been calculated with $T_{amb} = 25^{\circ}C$, $T_{junction} = 150^{\circ}C$.

3. TS419 stands 1.5KV on all pins except standby pin which stands 1KV.

4. Attention must be paid to continuous power dissipation ($V_{DD} \times 300mA$). Exposure of the IC to a short circuit for an extended time period is dramatically reducing product life expectancy.

OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	2 to 5.5	V
R_L	Load Resistor	≥ 16	Ω
T_{oper}	Operating Free Air Temperature Range	-40 to + 85	°C
C_L	Load Capacitor $R_L = 16$ to 100Ω $R_L > 100\Omega$	400 100	pF
V_{ICM}	Common Mode Input Voltage Range	GND to $V_{CC}-1V$	V
V_{STB}	Standby Voltage Input TS421 ACTIVE / TS419 in STANDBY TS421 in STANDBY / TS419 ACTIVE	$1.5 \leq V_{STB} \leq V_{CC}$ $GND \leq V_{STB} \leq 0.4$ ¹⁾	V
R_{THJA}	Thermal Resistance Junction to Ambient SO8 MiniSO8 DFN8 ²⁾	150 190 41	°C/W
T_{wu}	Wake-up time from standby to active mode ($C_b = 1\mu F$) ³⁾	≥ 0.12	s

1. The minimum current consumption ($I_{STANDBY}$) is guaranteed at V_{CC} (TS419) or GND (TS421) for the whole temperature range.

2. When mounted on a 4-layer PCB

3. For more details on T_{WU} , please refer to application note section on Wake-up time page 28.

FIXED GAIN VERSION SPECIFIC ELECTRICAL CHARACTERISTICS

V_{CC} from +5V to +2V, GND = 0V, T_{amb} = 25°C (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit
R _{IN}	Input Resistance		20		kΩ
G	Gain value for Gain TS419/TS421-2 Gain value for Gain TS419/TS421-4 Gain value for Gain TS419/TS421-8		6dB 12dB 18dB		dB

APPLICATION COMPONENTS INFORMATION

Components	Functional Description
R _{IN}	Inverting input resistor which sets the closed loop gain in conjunction with R _{FEED} . This resistor also forms a high pass filter with C _{IN} (f _{cl} = 1 / (2 x Pi x R _{IN} x C _{IN})). Not needed in fixed gain versions.
C _{IN}	Input coupling capacitor which blocks the DC voltage at the amplifier's input terminal
R _{FEED}	Feedback resistor which sets the closed loop gain in conjunction with R _{IN} . A _V = Closed Loop Gain= 2xR _{FEED} /R _{IN} . Not needed in fixed gain versions.
C _S	Supply Bypass capacitor which provides power supply filtering.
C _B	Bypass capacitor which provides half supply filtering.

TYPICAL APPLICATION SCHEMATICS:

APPLICATION INFORMATION

■ BTL Configuration Principle

The TS419 & TS420 are monolithic power amplifiers with a BTL output type. BTL (Bridge Tied Load) means that each end of the load is connected to two single-ended output amplifiers. Thus, we have:

Single ended output 1 = $V_{out1} = V_{out}$ (V)

Single ended output 2 = $V_{out2} = -V_{out}$ (V)

And $V_{out1} - V_{out2} = 2V_{out}$ (V)

The output power is :

$$P_{out} = \frac{(2 V_{out_{RMS}})^2}{R_L} \text{ (W)}$$

For the same power supply voltage, the output power in BTL configuration is four times higher than the output power in single ended configuration.

■ Gain In Typical Application Schematic (cf. page 3 of TS419-TS421 datasheet)

In the flat region (no C_{IN} effect), the output voltage of the first stage is:

$$V_{out1} = -V_{in} \frac{R_{feed}}{R_{in}} \text{ (V)}$$

For the second stage : $V_{out2} = -V_{out1}$ (V)

The differential output voltage is

$$V_{out2} - V_{out1} = 2 V_{in} \frac{R_{feed}}{R_{in}} \text{ (V)}$$

The differential gain named gain (G_v) for more convenient usage is :

$$G_v = \frac{V_{out2} - V_{out1}}{V_{in}} = 2 \frac{R_{feed}}{R_{in}}$$

Remark : V_{out2} is in phase with V_{in} and V_{out1} is phased 180° with V_{in} . This means that the positive terminal of the loudspeaker should be connected to V_{out2} and the negative to V_{out1} .

■ Low and high frequency response

In the low frequency region, C_{IN} starts to have an effect. C_{IN} forms with R_{IN} a high-pass filter with a -3dB cut off frequency .

$$F_{CL} = \frac{1}{2\pi R_{in} C_{in}} \text{ (Hz)}$$

In the high frequency region, you can limit the bandwidth by adding a capacitor (C_{feed}) in parallel with R_{feed} . It forms a low-pass filter with a -3dB cut off frequency .

$$F_{CH} = \frac{1}{2\pi R_{feed} C_{feed}} \text{ (Hz)}$$

■ Power dissipation and efficiency

Hypothesis:

- Load voltage and current are sinusoidal (V_{out} and I_{out})
- Supply voltage is a pure DC source (V_{cc})

Regarding the load we have:

$$V_{OUT} = V_{PEAK} \sin \omega t \text{ (V)}$$

and

$$I_{OUT} = \frac{V_{OUT}}{R_L} \text{ (A)}$$

and

$$P_{OUT} = \frac{V_{PEAK}^2}{2R_L} \text{ (W)}$$

Then, the average current delivered by the supply voltage is:

$$I_{CC_{AVG}} = 2 \frac{V_{PEAK}}{\pi R_L} \text{ (A)}$$

The power delivered by the supply voltage is:

$$P_{supply} = V_{cc} I_{CC_{AVG}} \text{ (W)}$$

Then, the **power dissipated by the amplifier** is:

$$P_{diss} = P_{supply} - P_{out} \text{ (W)}$$

$$P_{diss} = \frac{2\sqrt{2} V_{cc}}{\pi \sqrt{R_L}} \sqrt{P_{OUT}} - P_{OUT} \text{ (W)}$$

and the maximum value is obtained when:

$$\frac{\partial P_{diss}}{\partial P_{OUT}} = 0$$

and its value is:

$$P_{diss_{max}} = \frac{2V_{cc}^2}{\pi^2 R_L} \text{ (W)}$$

Remark : This maximum value is only dependent upon power supply voltage and load values.

The **efficiency** is the ratio between the output power and the power supply

$$\eta = \frac{P_{OUT}}{P_{supply}} = \frac{\pi V_{PEAK}}{4 V_{CC}}$$

The maximum theoretical value is reached when $V_{peak} = V_{CC}$, so

$$\frac{\pi}{4} = 78.5\%$$

■ Decoupling of the circuit

Two capacitors are needed to bypass properly the TS419/TS421. A power supply bypass capacitor C_S and a bias voltage bypass capacitor C_B .

C_S has particular influence on the THD+N in the high frequency region (above 7kHz) and an indirect influence on power supply disturbances. With 1μF, you can expect similar THD+N performances to those shown in the datasheet.

In the high frequency region, if C_S is lower than 1μF, it increases THD+N and disturbances on the power supply rail are less filtered.

On the other hand, if C_S is higher than 1μF, those disturbances on the power supply rail are more filtered.

C_B has an influence on THD+N at lower frequencies, but its function is critical to the final result of PSRR (with input grounded and in the lower frequency region).

If C_B is lower than 1μF, THD+N increases at lower frequencies and PSRR worsens.

If C_B is higher than 1μF, the benefit on THD+N at lower frequencies is small, but the benefit to PSRR is substantial.

Note that C_{IN} has a non-negligible effect on PSRR at lower frequencies. The lower the value of C_{IN} , the higher the PSRR.

■ Wake-up Time: T_{WU}

When standby is released to put the device ON, the bypass capacitor C_B will not be charged immediately. As C_B is directly linked to the bias of the amplifier, the bias will not work properly until the C_B voltage is correct. The time to reach this voltage is called wake-up time or T_{WU} and typically equal to:

$$T_{WU} = 0.15 \times C_B \text{ (s) with } C_B \text{ in } \mu\text{F}.$$

Due to process tolerances, the range of the wake-up time is :

$$0.12 \times C_B < T_{WU} < 0.18 \times C_B \text{ (s) with } C_B \text{ in } \mu\text{F}$$

Note : When the standby command is set, the time to put the device in shutdown mode is a few microseconds.

■ Pop performance

Pop performance is intimately linked with the size of the input capacitor C_{IN} and the bias voltage bypass capacitor C_B .

The size of C_{IN} is dependent on the lower cut-off frequency and PSRR values requested. The size of C_B is dependent on THD+N and PSRR values requested at lower frequencies.

Moreover, C_B determines the speed with which the amplifier turns ON. The slower the speed is, the softer the turn ON noise is.

The charge time of C_B is directly proportional to the internal generator resistance 150kΩ.

Then, the charge time constant for C_B is

$$\tau_B = 150\text{k}\Omega \times C_B \text{ (s)}$$

As C_B is directly connected to the non-inverting input (pin 2 & 3) and if we want to minimize, in amplitude and duration, the output spike on Vout1 (pin 5), C_{IN} must be charged faster than C_B . The equivalent charge time constant of C_{IN} is:

$$\tau_{IN} = (R_{in} + R_{feed}) \times C_{IN} \text{ (s)}$$

Thus we have the relation:

$$\tau_{IN} < \tau_B \text{ (s)}$$

Proper respect of this relation allows to minimize the pop noise.

Remark : Minimizing C_{IN} and C_B benefits both the pop phenomena, and the cost and size of the application.

■ Application : Differential inputs BTL power amplifier.

The schematic on figure 98, shows how to design the TS419/21 to work in a differential input mode.

The gain of the amplifier is: $G_{VDIFF} = 2 \frac{R_2}{R_1}$

In order to reach optimal performances of the differential function, R_1 and R_2 should be matched at 1% max.

Fig. 98 : Differential Input Amplifier Configuration

Input capacitance C can be calculated by the following formula using the -3dB lower frequency required. (F_L is the lower frequency required)

$$C \approx \frac{1}{2\pi R_1 F_L} (F)$$

Note : This formula is true only if:

$$F_{CB} = \frac{1}{942000 \times C_B} (Hz)$$

is ten times lower than F_L .

The following bill of material is an example of a differential amplifier with a gain of 2 and a -3dB lower cutoff frequency of about 80Hz.

Components :

Designator	Part Type
R1	20k / 1%
R2	20k / 1%
C	100nF
$C_B=C_S$	1μF
U1	TS419/21
