

DESCRIPTION

The SG1844/45 family of control ICs provides all the necessary features to implement off-line fixed frequency, current-mode switching power supplies with a minimum number of external components. Current-mode architecture demonstrates improved line regulation, improved load regulation, pulse-by-pulse current limiting and inherent protection of the power supply output switch.

The bandgap reference is trimmed to $\pm 1\%$ over temperature. Oscillator discharge current is trimmed to less than $\pm 10\%$. The SG1844/45 has under-voltage lockout, current-limiting circuitry

and start-up current of less than 1mA.

The totem-pole output is optimized to drive the gate of a power MOSFET. The output is low in the off state to provide direct interface to an N-channel device.

Both operate up to a maximum duty cycle range of zero to $<50\%$ due to an internal toggle flip-flop which blanks the output off every other clock cycle.

The SG1844/45 is specified for operation over the full military ambient temperature range of -55°C to 125°C . The SG2844/45 is specified for the industrial range of -25°C to 85°C , and the SG3844/45 is designed for the commercial range of 0°C to 70°C .

KEY FEATURES

- OPTIMIZED FOR OFF-LINE CONTROL
- LOW START-UP CURRENT ($<1\text{mA}$)
- AUTOMATIC FEED FORWARD COMPENSATION
- TRIMMED OSCILLATOR DISCHARGE CURRENT
- PULSE-BY-PULSE CURRENT LIMITING
- ENHANCED LOAD RESPONSE CHARACTERISTICS
- UNDER-VOLTAGE LOCKOUT WITH 6V HYSTERESIS (SG1844 only)
- DOUBLE PULSE SUPPRESSION
- HIGH-CURRENT TOTEM-POLE OUTPUT
- INTERNALLY TRIMMED BANDGAP REFERENCE
- 500kHz OPERATION
- UNDERVOLTAGE LOCKOUT
 - SG1844 - 16 volts
 - SG1845 - 8.4 volts
- LOW SHOOT-THROUGH CURRENT $<75\text{mA}$ OVER TEMPERATURE

APPLICATION INFORMATION

OSCILLATOR

The oscillator of the 1844/45 family of PWM's is programmed by the external timing components (R_T , C_T) as shown in Figure 13.

FIGURE 12 — OSCILLATOR TIMING CIRCUIT

FIGURE 13 — OSCILLATOR FREQUENCY vs. R_T FOR VARIOUS C_T

TYPICAL APPLICATION CIRCUITS

Pin numbers referenced are for 8-pin package and pin numbers in parenthesis are for 14-pin package.

FIGURE 14. — CURRENT SENSE SPIKE SUPPRESSION

The RC low-pass filter will eliminate the leading edge current spike caused by parasitics of Power MOSFET.

FIGURE 15. — MOSFET PARASITIC OSCILLATIONS

A resistor (R_1) in series with the MOSFET gate reduce overshoot and ringing caused by the MOSFET input capacitance and any inductance in series with the gate drive. (Note: It is very important to have a low inductance ground path to insure correct operation of the I.C. This can be done by making the ground paths as short and as wide as possible.)

FIGURE 16. — BIPOLAR TRANSISTOR DRIVE

The 1844/45 output stage can provide negative base current to remove base charge of power transistor (Q_1) for faster turn off. This is accomplished by adding a capacitor (C_1) in parallel with a resistor (R_1). The resistor (R_1) is to limit the base current during turn on.

$$I_{PK} = \frac{V(\text{PIN } 1) - 1.4}{3R_S} \left(\frac{N_P}{N_S} \right)$$

FIGURE 17. — ISOLATED MOSFET DRIVE

Current transformers can be used where isolation is required between PWM and Primary ground. A drive transformer is then necessary to interface the PWM output with the MOSFET.

TYPICAL APPLICATION CIRCUITS (continued)

FIGURE 18. — ADJUSTABLE BUFFERED REDUCTION OF CLAMP LEVEL WITH SOFTSTART

Softstart and adjustable peak current can be done with the external circuitry shown above.

FIGURE 19. — EXTERNAL DUTY CYCLE CLAMP AND MULTI-UNIT SYNCHRONIZATION

Precision duty cycle limiting for a duty cycle of <50%, as well as synchronizing several 1844/45's is possible with the above circuitry.

FIGURE 20. — OSCILLATOR CONNECTION

The oscillator is programmed by the values selected for the timing components R_T and C_T . Refer to application information for calculation of the component values.

FIGURE 21. — ERROR AMPLIFIER CONNECTION

Error amplifier is capable of sourcing and sinking current up to 0.5mA.
