

OP282/OP482

FEATURES

High Slew Rate: 9 V/ μ s
Wide Bandwidth: 4 MHz
Low Supply Current: 250 μ A/Amplifier
Low Offset Voltage: 3 mV
Low Bias Current: 100 pA
Fast Settling Time
Common-Mode Range Includes V+
Unity Gain Stable

APPLICATIONS

Active Filters
Fast Amplifiers
Integrators
Supply Current Monitoring

GENERAL DESCRIPTION

The OP282/OP482 dual and quad operational amplifiers feature excellent speed at exceptionally low supply currents. Slew rate exceeds 7 V/ μ s with supply current under 250 μ A per amplifier. These unity gain stable amplifiers have a typical gain bandwidth of 4 MHz.

The JFET input stage of the OP282/OP482 ensures bias current is typically a few picoamps and below 500 pA over the full temperature range. Offset voltage is under 3 mV for the dual and under 4 mV for the quad.

With a wide output swing, within 1.5 V of each supply, low power consumption, and high slew rate, the OP282/OP482 are ideal for battery powered systems or power restricted applications. An input common-mode range that includes the positive supply makes the OP282/OP482 an excellent choice for high-side signal conditioning.

The OP282/OP482 are specified over the extended industrial temperature range. Both dual and quad amplifiers are available in plastic DIP plus SOIC surface mount packages.

DYNAMIC PERFORMANCE						
Slew Rate	SR	$R_L = 10\text{ k}\Omega$	7	9		$\text{V}/\mu\text{s}$
Full-Power Bandwidth	BW_P	1% Distortion		125		kHz
Settling Time	t_s	To 0.01%		1.6		μs
Gain Bandwidth Product	GBP			4		MHz
Phase Margin	θ_O			55		Degrees
NOISE PERFORMANCE						
Voltage Noise	e_n p-p	0.1 Hz to 10 Hz		1.3		$\mu\text{V p-p}$
Voltage Noise Density	e_n	$f = 1\text{ kHz}$		36		$\text{nV}/\sqrt{\text{Hz}}$
Current Noise Density	i_n			0.01		$\text{pA}/\sqrt{\text{Hz}}$

NOTE

¹The input bias and offset currents are tested at $T_A = T_J = 85^\circ\text{C}$. Bias and offset currents are guaranteed but not tested at -40°C .

Specifications subject to change without notice.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	±18 V
Input Voltage ¹	±18 V
Differential Input Voltage ¹	36 V
Output Short-Circuit Duration	Indefinite
Storage Temperature Range	
P, S Packages	-65°C to +150°C
Operating Temperature Range	
OP282G, OP482G	-40°C to +85°C
Junction Temperature Range	
P, S Packages	-65°C to +125°C
Lead Temperature Range (Soldering 60 sec)	300°C

Package Type	θ_{JA}^2	θ_{JC}	Units
8-Pin Plastic DIP (P)	103	43	°C/W
8-Pin SOIC (S)	158	43	°C/W
14-Pin Plastic DIP (P)	83	39	°C/W
14-Pin SOIC (S)	120	36	°C/W

NOTES

¹For supply voltages less than ±18 V, the absolute maximum input voltage is equal to the supply voltage.

² θ_{JA} is specified for the worst case conditions; i.e., θ_{JA} is specified for device in socket for cerdip, PDIP; θ_{JA} is specified for device soldered in circuit board for SOIC package.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the OP282/OP482 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high-energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

APPLICATIONS INFORMATION

The OP282 and OP482 are single and dual JFET op amps that have been optimized for high speed at low power. This combination makes these amplifiers excellent choices for battery powered or low power applications requiring above average performance. Applications benefiting from this performance combination include telecom, geophysical exploration, portable medical equipment, and navigational instrumentation.

HIGH-SIDE SIGNAL CONDITIONING

There are many applications that require the sensing of signals near the positive rail. OP282s and OP482s have been tested and guaranteed over a common-mode range ($-11\text{ V} \leq V_{CM} \leq +15\text{ V}$) that includes the positive supply.

One application where this is commonly used is in the sensing of power supply currents. This enables it to be used in current sensing applications such as the partial circuit shown in Figure 1. In this circuit, the voltage drop across a low value resistor, such as the $0.1\ \Omega$ shown here, is amplified and compared to 7.5 V . The output can then be used for current limiting.

Figure 1. Phase Inversion

PHASE INVERSION

Most JFET-input amplifiers will invert the phase of the input signal if either input exceeds the input common-mode range. For the OP282 and OP482, negative signals in excess of approximately 14 V will cause phase inversion. The cause of this effect is saturation of the input stage leading to the forward-biasing of a drain-gate diode. A simple fix for this in noninverting applications is to place a resistor in series with the noninverting input. This limits the amount of current through the forward-biased diode and prevents the shutting down of the output stage. For the OP282/OP482, a value of $200\text{ k}\Omega$ has been found to work. However, this adds a significant amount of noise.

Figure 2. OP282 Phase Reversal

ACTIVE FILTERS

The wide bandwidth and high slew rates of the OP282 and OP482 make either an excellent choice for many filter applications.

There are many types of active filter configurations, but the four most popular configurations are Butterworth, Elliptical, Bessel, and Chebyshev. Each type has a response that is optimized for a given characteristic as shown in Table I.

Table I.

Type	Selectivity	Overshoot	Phase	Amplitude (Pass Band)	Amplitude (Stop Band)
Butterworth	Moderate	Good	Nonlinear	Max Flat	Equal Ripple
Chebyshev	Good	Moderate		Equal Ripple	
Elliptical	Best	Poor	Equal Ripple		
Bessel (Thompson)	Poor	Best	Linear		

OP282/OP482

PROGRAMMABLE STATE-VARIABLE FILTER

The circuit shown in Figure 3 can be used to accurately program the “Q,” the cutoff frequency f_c , and the gain of a two pole state-variable filter. OP482s have been used in this design because of their high bandwidths, low power, and low noise. This circuit takes only three packages to build because of the quad configuration of the op amps and DACs.

The DACs shown are used in the voltage mode so too many values are dependent only on the accuracy of the DAC and not on the absolute values of the DAC’s resistive ladders. This makes this circuit unusually accurate for a programmable filter.

Adjusting DAC 1 changes the signal amplitude across R1; therefore, the DAC attenuation times R1 determines the amount of signal current that charges the integrating capacitor, C1. This cutoff frequency can now be expressed as:

$$f_c = \frac{1}{2\pi R_1 C_1} \left(\frac{D_1}{256} \right)$$

where D_1 is the digital code for the DAC.

Gain of this circuit is set by adjusting D_3 . The gain equation is:

$$Gain = \frac{R_4}{R_5} \left(\frac{D_3}{256} \right)$$

DAC 2 is used to set the “Q” of the circuit. Adjusting this DAC controls the amount of feedback from the band-pass node to the input summing node. Note that the digital value of the DAC is in the numerator; therefore, zero code is not a valid operating point.

$$Q = \frac{R_2}{R_3} \left(\frac{256}{D_2} \right)$$

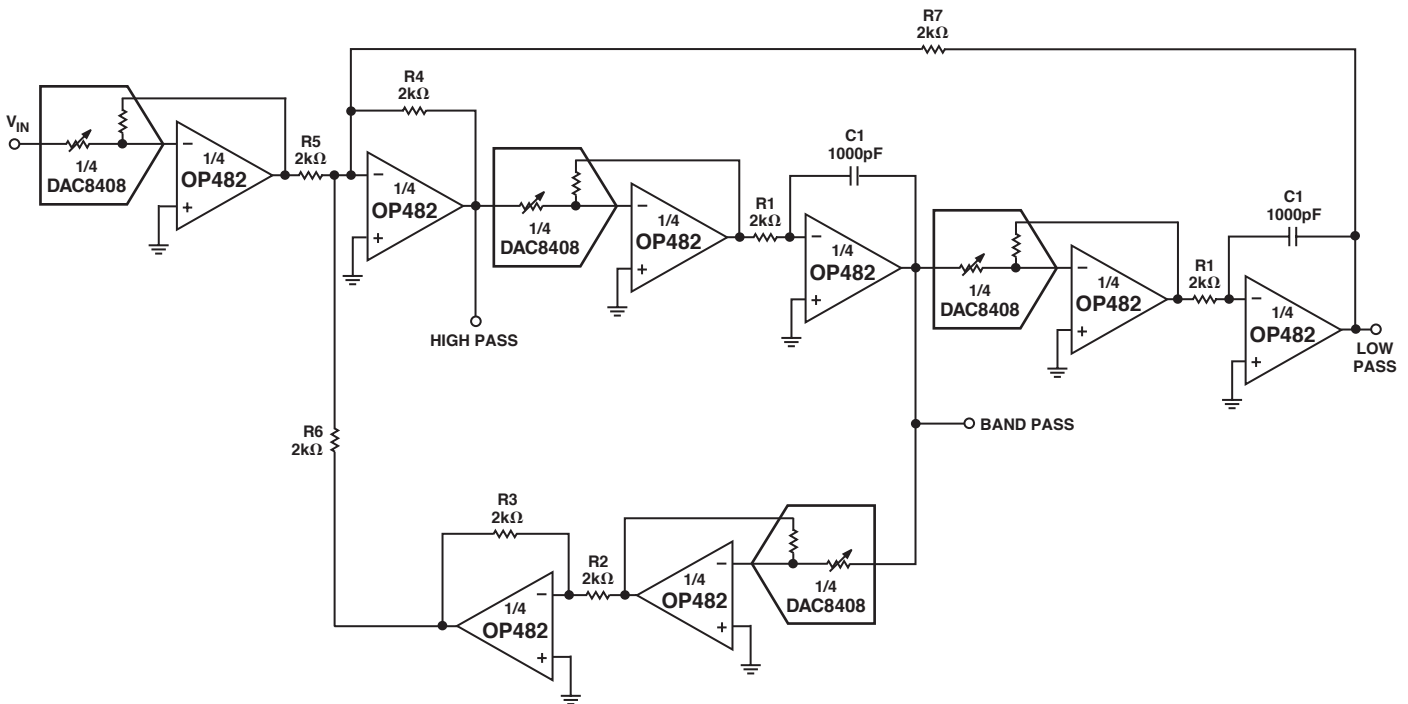

Figure 3.

OP282/OP482 SPICE MACRO MODEL

Figure 4 shows the OP282 SPICE macro model. The model for the OP482 is similar to that of the OP282, but there are some

minor changes in the circuit values. Contact ADI for a copy of the latest SPICE model diskette for both listings.
