

FEATURES

- Low Offset Voltage: 50 μV Max
- Low Offset Voltage Drift: 0.6 $\mu\text{V}/^\circ\text{C}$ Max
- Very Low Bias Current: 100 pA Max
- Very High Open-Loop Gain: 2000 V/mV Min
- Low Supply Current (Per Amplifier): 625 μA Max
- Operates From $\pm 2\text{ V}$ to $\pm 20\text{ V}$ Supplies
- High Common-Mode Rejection: 120 dB Min
- Pin Compatible to LT1013, AD706, AD708, OP221, LM158 and MC1458/1558 with Improved Performance

APPLICATIONS

- Strain Gauge and Bridge Amplifiers
- High Stability Thermocouple Amplifiers
- Instrumentation Amplifiers
- Photo-Current Monitors
- High Gain Linearity Amplifiers
- Long-Term Integrators/Filters
- Sample-and-Hold Amplifiers
- Peak Detectors
- Logarithmic Amplifiers
- Battery Powered Systems

GENERAL DESCRIPTION

The OP297 is the first dual op amp to pack precision performance into the space-saving, industry standard, 8-lead SOIC package. Its combination of precision with low power and extremely low input bias current makes the dual OP297 useful in a wide variety of applications.

Precision performance of the OP297 includes very low offset, under 50 μV , and low drift, below 0.6 $\mu\text{V}/^\circ\text{C}$. Open-loop gain exceeds 2000 V/mV, ensuring high linearity in every application.

Figure 1. Low Bias Current Over Temperature

Figure 2. Very Low Offset

PIN CONNECTIONS

- 8-Lead Plastic DIP
- 8-Lead Cerdip
- 8-Lead Narrow Body SOIC

Errors due to common-mode signals are eliminated by the OP297's common-mode rejection of over 120 dB, which minimizes offset voltage changes experienced in battery powered systems. Supply current of the OP297 is under 625 μA per amplifier and it can operate with supply voltages as low as $\pm 2\text{ V}$.

The OP297 uses a super-beta input stage with bias current cancellation to maintain picoamp bias currents at all temperatures. This is in contrast to FET input op amps whose bias currents start in the picoamp range at 25 $^\circ\text{C}$, but double for every 10 $^\circ\text{C}$ rise in temperature, to reach the nanoamp range above 85 $^\circ\text{C}$. Input bias current of the OP 297 is under 100 pA at 25 $^\circ\text{C}$ and is under 450 pA over the military temperature range.

Combining precision, low power and low bias current, the OP297 is ideal for a number of applications, including instrumentation amplifiers, log amplifiers, photodiode preamplifiers and long-term integrators. For a single device, see the OP97; for a quad, see the OP497.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the OP297 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

APPLICATIONS INFORMATION

Extremely low bias current over a wide temperature range makes the OP297 attractive for use in sample-and-hold amplifiers, peak detectors and log amplifiers that must operate over a wide temperature range. Balancing input resistances is unnecessary with the OP297. Offset voltage and TCV_{OS} are degraded only minimally by high source resistance, even when unbalanced.

The input pins of the OP297 are protected against large differential voltage by back-to-back diodes and current-limiting resistors. Common-mode voltages at the inputs are not restricted, and may vary over the full range of the supply voltages used.

The OP297 requires very little operating headroom about the supply rails, and is specified for operation with supplies as low as +2 V. Typically, the common-mode range extends to within one volt of either rail. The output typically swings to within one volt of the rails when using a 10 kΩ load.

AC PERFORMANCE

The OP297's ac characteristics are highly stable over its full operating temperature range. Unity gain small-signal response is shown in Figure 25. Extremely tolerant of capacitive loading on the output, the OP297 displays excellent response with 1000 pF loads (Figure 26).

Figure 26. Small-Signal Transient Response ($C_{LOAD} = 1000 \text{ pF}$, $A_{VCL} = +1$)

Figure 27. Large-Signal Transient Response ($A_{VCL} = +1$)

Figure 25. Small-Signal Transient Response ($C_{LOAD} = 100 \text{ pF}$, $A_{VCL} = +1$)

OP297

Figure 28. Guard Ring Layout and Connections

GUARDING AND SHIELDING

To maintain the extremely high input impedances of the OP297, care must be taken in circuit board layout and manufacturing. Board surfaces must be kept scrupulously clean and free of moisture. Conformal coating is recommended to provide a humidity barrier. Even a clean PC board can have 100 pA of leakage currents between adjacent traces, so guard rings should be used around the inputs. Guard traces are operated at a voltage close to that on the inputs, as shown in Figure 28, so that leakage currents become minimal. In noninverting applications, the guard ring should be connected to the common-mode voltage at the inverting input. In inverting applications, both inputs remain at ground, so the guard trace should be grounded. Guard traces should be on both sides of the circuit board.

OPEN-LOOP GAIN LINEARITY

The OP297 has both an extremely high gain of 2000 V/mV minimum and constant gain linearity. This enhances the precision of the OP297 and provides for very high accuracy in high closed loop gain applications. Figure 29 illustrates the typical open-loop gain linearity of the OP297 over the military temperature range.

Figure 29. Open-Loop Linearity of the OP297

APPLICATIONS

PRECISION ABSOLUTE VALUE AMPLIFIER

The circuit of Figure 30 is a precision absolute value amplifier with an input impedance of 30 MΩ. The high gain and low TCV_{OS} of the OP297 ensure accurate operation with microvolt input signals. In this circuit, the input always appears as a common-mode signal to the op amps. The CMR of the OP297 exceeds 120 dB, yielding an error of less than 2 ppm.

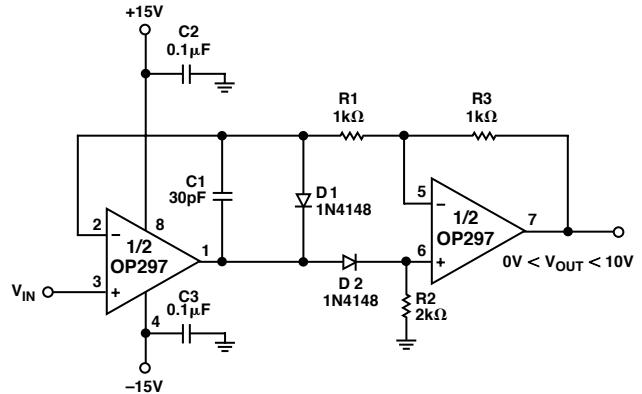

Figure 30. Precision Absolute Value Amplifier

PRECISION CURRENT PUMP

Maximum output current of the precision current pump shown in Figure 31 is ±10 mA. Voltage compliance is ±10 V with ±15 V supplies. Output impedance of the current transmitter exceeds 3 MΩ with linearity better than 16 bits.

Figure 31. Precision Current Pump

PRECISION POSITIVE PEAK DETECTOR

In Figure 32, the C_H must be of polystyrene, Teflon®, or polyethylene to minimize dielectric absorption and leakage. The droop rate is determined by the size of C_H and the bias current of the OP297.

SIMPLE BRIDGE CONDITIONING AMPLIFIER

Figure 33 shows a simple bridge conditioning amplifier using the OP297. The transfer function is:

$$V_{OUT} = V_{REF} \left(\frac{\Delta R}{R + \Delta R} \right) \frac{R_F}{R}$$

The REF43 provides an accurate and stable reference voltage for the bridge. To maintain the highest circuit accuracy, R_F should be 0.1% or better with a low temperature coefficient.

Figure 32. Precision Positive Peak Detector

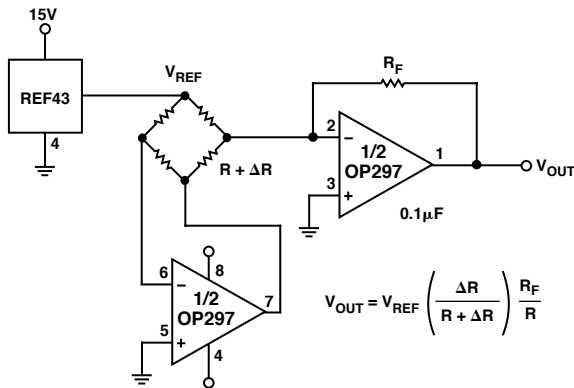

Figure 33. A Simple Bridge Conditioning Amplifier Using the OP297

NONLINEAR CIRCUITS

Due to its low input bias currents, the OP297 is an ideal log amplifier in nonlinear circuits such as the square and square-root circuits shown in Figures 34 and 35. Using the squaring circuit of Figure 34 as an example, the analysis begins by writing a voltage loop equation across transistors Q1, Q2, Q3 and Q4.

$$V_{T1} \ln \left(\frac{I_{IN}}{I_{S1}} \right) + V_{T2} \ln \left(\frac{I_{IN}}{I_{S2}} \right) = V_{T3} \ln \left(\frac{I_O}{I_{S3}} \right) + V_{T4} \ln \left(\frac{I_{REF}}{I_{S4}} \right)$$

All the transistors of the MAT04 are precisely matched and at the same temperature, so the I_S and V_T terms cancel, giving:

$$2 \ln I_{IN} = \ln I_O + \ln I_{REF} = \ln (I_O \times I_{REF})$$

Exponentiating both sides of the equation leads to:

$$I_O = \frac{(I_{IN})^2}{I_{REF}}$$

Op amp A2 forms a current-to-voltage converter which gives $V_{OUT} = R2 \times I_O$. Substituting $(V_{IN}/R1)$ for I_{IN} and the above equation for I_O yields:

$$V_{OUT} = \left(\frac{R2}{I_{REF}} \right) \left(\frac{V_{IN}}{R1} \right)^2$$

A similar analysis made for the square-root circuit of Figure 35 leads to its transfer function:

$$V_{OUT} = R2 \sqrt{\frac{(V_{IN})(I_{REF})}{R1}}$$

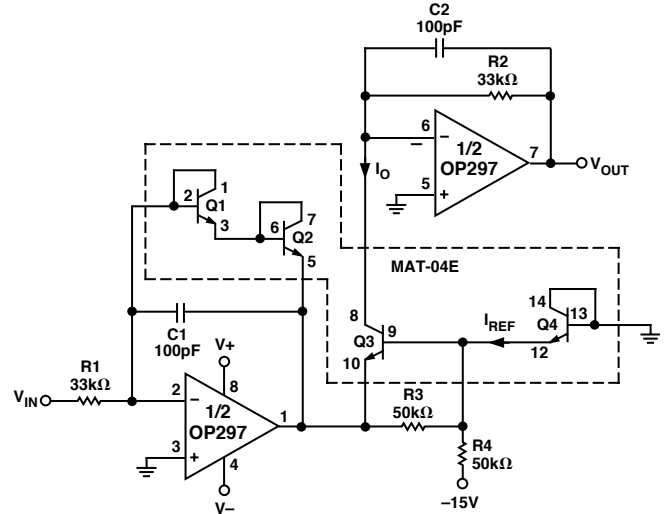

Figure 34. Squaring Amplifier

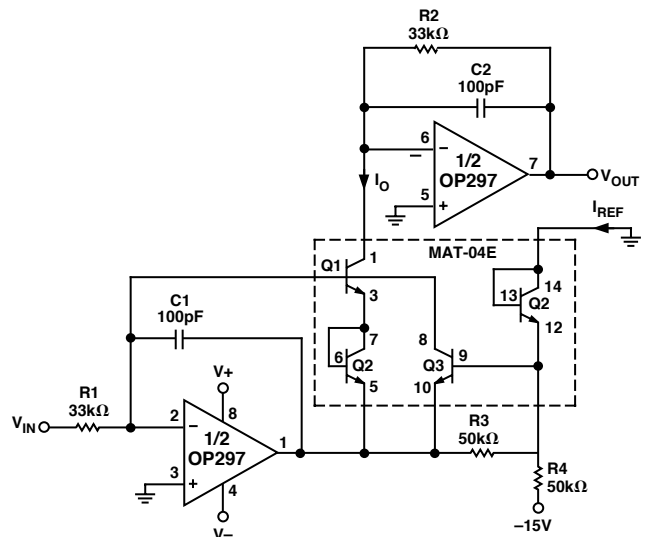

Figure 35. Square-Root Amplifier

Teflon is a registered trademark of the Dupont Company

OP297

In these circuits, I_{REF} is a function of the negative power supply. To maintain accuracy, the negative supply should be well regulated. For applications where very high accuracy is required, a voltage reference may be used to set I_{REF} . An important consideration for the squaring circuit is that a sufficiently large input voltage can force the output beyond the operating range of the output op amp. Resistor R4 can be changed to scale I_{REF} , or R1, and R2 can be varied to keep the output voltage within the usable range.

Unadjusted accuracy of the square-root circuit is better than 0.1% over an input voltage range of 100 mV to 10 V. For a similar input voltage range, the accuracy of the squaring circuit is better than 0.5%.

OP297 SPICE MACRO-MODEL

Figures 36 and 37 show the node end net list for a SPICE macro model of the OP297. The model is a simplified version of the actual device and simulates important dc parameters such as V_{OS} , I_{OS} , I_B , A_{VO} , CMR, V_O and I_{SY} . AC parameters such as slew rate, gain and phase response and CMR change with frequency are also simulated by the model.

The model uses typical parameters for the OP297. The poles and zeros in the model were determined from the actual open- and closed-loop gain and phase response of the OP297. In this way, the model presents an accurate ac representation of the actual device. The model assumes an ambient temperature of 25°C.
