32K x 32 SYNCHRONOUS PIPELINED STATIC RAM

FEATURES

- Fast access time:
 - 4 ns-125 MHz; 5 ns-100 MHz;
 - 6 ns-83 MHz; 7 ns-75 MHz; 8 ns-66 MHz
- Internal self-timed write cycle
- Individual Byte Write Control and Global Write
- Clock controlled, registered address, data and control
- Pentium™ or linear burst sequence control using MODE input
- Three chip enables for simple depth expansion and address pipelining
- Common data inputs and data outputs
- Power-down control by ZZ input
- JEDEC 100-Pin LQFP and PQFP package
- Single +3.3V power supply
- Two Clock enables and one Clock disable to eliminate multiple bank bus contention.
- Control pins mode upon power-up:
 - MODE in interleave burst mode
 - ZZ in normal operation mode
 These control pins can be connected to GNDQ or VCCQ to alter their power-up state

DESCRIPTION

The *ICSI* IC61C632A is a high-speed, low-power synchronous static RAM designed to provide a burstable, high-performance, secondary cache for the i486™, Pentium™, 680X0™, and PowerPC™ microprocessors. It is organized as 32,768 words by 32 bits, fabricated with *ICSI*'s advanced CMOS technology. The device integrates a 2-bit burst counter, high-speed SRAM core, and high-drive capability outputs into a single monolithic circuit. All synchronous inputs pass through registers controlled by a positive-edge-triggered single clock input.

Write cycles are internally self-timed and are initiated by the rising edge of the clock input. Write cycles can be from one to four bytes wide as controlled by the write control inputs.

Separate byte enables allow individual bytes to be written. $\overline{BW1}$ controls DQ1-DQ8, $\overline{BW2}$ controls DQ9-DQ16, $\overline{BW3}$ controls DQ17-DQ24, $\overline{BW4}$ controls DQ25-DQ32, conditioned by $\overline{BWE}$ being LOW. A LOW on $\overline{GW}$ input would cause all bytes to be written.

Bursts can be initiated with either $\overline{ADSP}$ (Address Status Processor) or $\overline{ADSC}$ (Address Status Cache Controller) input pins. Subsequent burst addresses can be generated internally by the IC61C632A and controlled by the $\overline{ADV}$ (burst address advance) input pin.

Asynchronous signals include output enable ($\overline{OE}$), sleep mode input (ZZ), clock (CLK) and burst mode input (MODE). A HIGH input on the ZZ pin puts the SRAM in the power-down state. When ZZ is pulled LOW (or no connect), the SRAM normally operates after three cycles of the wake-up period. A LOW input, i.e., GNDQ, on MODE pin selects LINEAR Burst. A VCCQ (or no connect) on MODE pin selects INTERLEAVED Burst.

Notes:

1. All inputs except $\overline{OE}$ must meet setup and hold times for the Low-to-High transition of clock (CLK).
2. Wait states are inserted by suspending burst.
3. X means don't care. $\overline{WRITE}=L$ means any one or more byte write enable signals ($\overline{BW1}$ - $\overline{BW4}$) and $\overline{BWE}$ are LOW or $\overline{GW}$ is LOW. $\overline{WRITE}=H$ means all byte write enable signals are HIGH.
4. For a Write operation following a Read operation, $\overline{OE}$ must be HIGH before the input data required setup time and held HIGH throughout the input data hold time.
5. $\overline{ADSP}$ LOW always initiates an internal READ at the Low-to-High edge of clock. A WRITE is performed by setting one or more byte write enable signals and $\overline{BWE}$ LOW or $\overline{GW}$ LOW for the subsequent L-H edge of clock.

Notes:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, precautions may be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.
3. This device contains circuitry that will ensure the output devices are in High-Z at power up.

Timing diagram for ADSP, ADSC, ADV, A14-A0, GW, BWE, BW4-BW1, CE1, CE2, CE3, OE, DATAOUT, and DATAIN signals. The diagram shows various timing parameters and annotations:

- CLK**: Clock signal.
- ADSP**: Address Strobe Port. Timing parameters: t_{ss} , t_{sh} , t_{kc} , t_{kL} . Annotation: "ADSP is blocked by $\overline{CE1}$ inactive".
- ADSC**: Address Strobe Clock. Annotation: "ADSC initiate Write".
- ADV**: Address Valid. Timing parameters: t_{AVS} , t_{AVH} . Annotation: "ADV must be inactive for ADSP Write".
- A14-A0**: Address bus. Timing parameters: t_{AS} , t_{AH} . Annotations: "WR1", "WR2", "WR3".
- GW**: Global Write. Timing parameters: t_{WS} , t_{WH} .
- BWE**: Burst Write Enable. Timing parameters: t_{WS} , t_{WH} .
- BW4-BW1**: Burst Write Address. Timing parameters: t_{WS} , t_{WH} . Annotations: "WR1", "WR2", "WR3".
- CE1**: Chip Enable 1. Timing parameters: t_{CES} , t_{CEH} . Annotation: "CE1 Masks ADSP".
- CE2**: Chip Enable 2. Timing parameters: t_{CES} , t_{CEH} . Annotation: "CE2 and CE3 only sampled with ADSP or ADSC".
- CE3**: Chip Enable 3. Timing parameters: t_{CES} , t_{CEH} . Annotation: "Unselected with CE2".
- OE**: Output Enable.
- DATAOUT**: Data Output. Annotation: "High-Z".
- DATAIN**: Data Input. Timing parameters: t_{DS} , t_{DH} . Annotations: "1a", "2a", "2b", "2c", "2d", "3a".

Phases: Single Write, Burst Write, Write, Unselected.

1. The assertion of ZZ allows the SRAM to enter a lower power state than when deselected within the time specified. Data retention is guaranteed when ZZ is asserted and clock remains active.
2. $\overline{\text{ADSC}}$ and $\overline{\text{ADSP}}$ must not be asserted for at least 2 cyc after leaving ZZ state.
3. Configuration signal MODE is static and must not change during normal operation.
4. Guaranteed but not 100% tested. This parameter is periodically sampled.
5. Tested with the load in Figure 2.
