1/8 to 1/10 Duty Dot Matrix LCD Display Controller/Driver

Overview

The LC75811E and LC75811W are 1/8 to 1/10 duty dot matrix LCD display controller/drivers that supports the display of characters, numbers, and symbols. In addition to generating dot matrix LCD drive signals based on data transferred serially from a microcontroller, the LC75811E and LC75811W also provide on-chip character display ROM and RAM to allow display systems to be implemented easily.

Features

- Controls and drives a 5×7 , 5×8 , or 5×9 dot matrix LCD.
- Supports accessory display segment drive (up to 60 segments)
- Display technique: 1/8 duty 1/4 bias drive (5×7 dots)
1/9 duty 1/4 bias drive (5×8 dots)
1/10 duty 1/4 bias drive (5×9 dots)
- Display digits: 12 digits \times 1 line (5×7 dots),
11 digits \times 1 line (5×8 or 5×9 dots)
- Display control memory
CGROM: 240 characters (5×7 , 5×8 , or 5×9 dots)
CGRAM: 16 characters (5×7 , 5×8 , or 5×9 dots)
ADRAM: 12×5 bits
DCRAM: 48×8 bits
- Instruction function
Display on/off control
Display shift function
- Provides a backup function based on low power modes.
- Serial data input supports CCB format communication with the system controller.
- Independent LCD drive block power supply VLCD
- Provides a RES pin for LSI internal initialization
- RC oscillator circuit

Block Functions

- AC (address counter)

AC is a counter that provides the addresses used for DCRAM and ADRAM.

The address is automatically modified internally, and the LCD display state is retained.

- DCRAM (data control RAM)

DCRAM is RAM that is used to store display data expressed as 8-bit character codes. (These character codes are converted to 5×7 , 5×8 , or 5×9 dot matrix character patterns using CGROM or CGRAM.) DCRAM has a capacity of 48×8 bits, and can hold 48 characters. The table below lists the correspondence between the 6-bit DCRAM address loaded into AC and the display position on the LCD panel.

- When the DCRAM address loaded into AC is 00_H .

| | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|
| Display digit | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| DCRAM address (hexadecimal) | 00 | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 0A | 0B |

However, when the display shift is performed by specifying MDATA, the DCRAM address shifts as shown below.

| | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|
| Display digit | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |

Note:*2. The DCRAM addresses are expressed in hexadecimal.

Example: When the DCRAM address is $2E_H$.

| | | | | | |

 5×8 dots ... 12-digit display 4×8 dots
 5×9 dots ... 12-digit display 3×9 dots

- **ADRAM (Additional data RAM)**

ADRAM is RAM used to store the ADATA display data. ADRAM has a capacity of 12×5 bits, and the stored display data is displayed directly without the use of CGROM or CGRAM. The table below lists the correspondence between the 4-bit ADRAM address loaded into AC and the display position on the LCD panel.

- When the ADRAM address loaded into AC is 0_H . (Number of digit displayed: 12)

| | | | | | | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|---|---|----|----|----|
| Display digit | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| ADRAM address (hexadecimal) | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B |

However, when the display shift is performed by specifying ADATA, the ADRAM address shifts as shown below.

| | | | | | | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|---|---|----|----|----|
| Display digit | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| ADRAM address (hexadecimal) | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | 0 |

| | | | | | | | | | | | | |
|-----------------------------|---|---|---|---|---|---|---|---|---|----|----|----|
| Display digit | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| ADRAM address (hexadecimal) | B | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A |

(Right shift)

Note: *4. The ADRAM addresses are expressed in hexadecimal.

Example: When the ADRAM address is A_H

| | | | |
|-----|-----|-----|-----|
| RA0 | RA1 | RA2 | RA3 |
| 0 | 1 | 0 | 1 |

Note: *5. 5×7 dots ... 12-digit display 5 dots
 5×8 dots ... 12-digit display 4 dots
 5×9 dots ... 12-digit display 3 dots

- **CGROM (Character generator ROM)**

CGROM is ROM used to generate the 240 kinds of 5×7 , 5×8 , or 5×9 dot matrix character patterns from the 8-bit character codes. CGROM has a capacity of 240×45 bits. When a character code is written to DCRAM, the character pattern stored in CGROM corresponding to the character code is displayed at the position on the LCD corresponding to the DCRAM address loaded into AC.

- **CGRAM (Character generator RAM)**

CGRAM is RAM to which user programs can freely write arbitrary character patterns. Up to 16 kinds of 5×7 , 5×8 , or 5×9 dot matrix character patterns can be stored. CGRAM has a capacity of 16×45 bits.

Reset Function

The LC75811E and LC75811W are reset when a low level is applied to the $\overline{\text{RES}}$ pin at power on and, in normal mode. On a reset the LC75811E and LC75811W create a display with all LCD panels turned off. However, after a reset applications must set the contents of DCRAM, ADRAM, and CGRAM before turning on display with a “display on/off control” instruction since the contents of these memories are undefined. That is, applications must execute the following instructions.

- Set display technique
- DCRAM data write
- ADRAM data write (If ADRAM is used.)
- CGRAM data write (If CGRAM is used.)
- Set AC address

After executing the above instructions, applications must turn on the display with a “display on/off control” instruction. Note that when applications turn off in the normal mode, applications must turn off the display with a “display on/off control” instruction. (See the detailed instruction descriptions.)

- CCB address: 47H
- D0 to D63: Instruction data

The data is acquired on the rising edge of the CL signal and latched on the falling edge of the CE signal. When transferring instruction data from the microcontroller, applications must assure that the time from the transfer of one set of instruction data until the next instruction data transfer is significantly longer than the instruction execution time.

Notes:*6. The data format differs when the "DCRAM data write" instruction is executed in the increment mode (IM = 1).
(See detailed instruction descriptions.)

*7. The data format differs when the "ADRAM data write" instruction is executed in the increment mode (IM = 1).
(See detailed instruction descriptions.)

*8. The execution times listed here apply when fosc = 300 kHz. The execution times differ when the oscillator frequency fosc differs.
Example: When fosc = 210 kHz

$$27 \mu s \times \frac{300}{210} = 39 \mu s$$

*9. When the power saving mode (BU = 1) is set, the execution time is 27 μs (when fosc = 300 kHz).

AD1 to AD5: ADATA display data

In addition to the 5×7 , 5×8 , or 5×9 dot matrix display data (MDATA), this LSI supports direct display of the five accessory display segments provided in each digit as ADATA. This display function does not use CGROM or CGRAM. The figure below shows the correspondence between the data and the display. When $AD_n = 1$ (where n is an integer between 1 and 5) the segment corresponding to that data will be turned on.

| ADATA | Corresponding output pin |

| AD1 | $S5m + 1$ (m is an integer between 0 and 11) |
| AD2 | $S5m + 2$ |
| AD3 | $S5m + 3$ |

Notes on the Power On and Power Off Sequences

- At power on: Logic block power supply (V_{DD}) on \rightarrow LCD driver block power supply (V_{LCD}) on
- At power off: LCD driver block power supply (V_{LCD}) off \rightarrow Logic block power supply (V_{DD}) off

However, if the logic and LCD driver block use a shared power supply, then the power supplies can be turned on and off at the same time.
