

Document Title

256Kx36 & 512Kx18-Bit Synchronous Pipelined Burst SRAM

Revision History

<u>Rev. No.</u>	<u>History</u>	<u>Draft Date</u>	<u>Remark</u>
0.0	Initial draft	May. 24 . 2000	Preliminary
1.0	1. Final spec Release.	July. 03. 2000	Final

The attached data sheets are prepared and approved by SAMSUNG Electronics. SAMSUNG Electronics CO., LTD. reserve the right to change the specifications. SAMSUNG Electronics will evaluate and reply to your requests and questions on the parameters of this device. If you have any questions, please contact the SAMSUNG branch office near your office, call or contact Headquarters.

FEATURES

- ## GENERAL DESCRIPTION

It is organized as 256K(512K) words of 36(18) bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance cache RAM applications; $\overline{GW}$, $\overline{BW}$, $\overline{LBO}$, $\overline{ZZ}$. Write cycles are internally self-timed and synchronous.

Burst cycle can be initiated with either the address status processor (ADSP) or address status cache controller (ADSC) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance (ADV) input. LBO pin is DC operated and determines burst sequence (linear or interleaved).

The K7A803601A and K7A801801A are fabricated using SAMSUNG's high performance CMOS technology and is available in a 100pin TQFP package. Multiple power and ground pins are utilized to minimize ground bounce.

PARAMETER	Symbol	-16	-15	-14	-11	-10	Unit
Cycle Time	tcyc	6.0	6.7	7.2	8.5	10	ns
Clock Access Time	tcd	3.5	3.8	4.0	4.2	4.5	ns
Output Enable Access Time	toe	3.5	3.8	4.0	4.2	4.5	ns

The diagram illustrates the internal architecture of the ADSP-B57100. It features a central **CONTROL LOGIC** block that interfaces with various control and data components:

- Control Registers:** Two **CONTROL REGISTER** blocks are shown. The first is connected to $\overline{\text{CLK}}$, $\overline{\text{LBO}}$, $\overline{\text{ADV}}$, and $\overline{\text{ADSC}}$. The second is connected to $\overline{\text{ADSP}}$, $\overline{\text{CS1}}$, $\overline{\text{CS2}}$, $\overline{\text{CS2}}$, $\overline{\text{GW}}$, $\overline{\text{BW}}$, $\overline{\text{WEx}}$ (where $x=a,b,c,d$ or a,b), $\overline{\text{OE}}$, and $\overline{\text{ZZ}}$.
- Burst Control Logic:** Receives inputs from the first control register and the **CONTROL LOGIC**. It outputs to the **BURST ADDRESS COUNTER** and the **ADDRESS REGISTER**.
- Burst Address Counter:** Outputs $A'0 \sim A'1$ to the **256Kx36, 512Kx18 MEMORY ARRAY**.
- Address Register:** Receives $A0 \sim A17$ or $A0 \sim A18$ from the **CONTROL LOGIC** and $A0 \sim A1$ from the **BURST CONTROL LOGIC**. It outputs $A2 \sim A17$ or $A2 \sim A18$ to the **DATA-IN REGISTER**.
- Memory Array:** A **256Kx36, 512Kx18 MEMORY ARRAY** that provides data to the **DATA-IN REGISTER** and the **OUTPUT REGISTER/BUFFER**.
- Data Path:** The **DATA-IN REGISTER** receives data from the **ADDRESS REGISTER** and the **MEMORY ARRAY**. The **OUTPUT REGISTER/BUFFER** receives data from the **MEMORY ARRAY** and outputs $DQa0 \sim DQd7$ or $DQa0 \sim DQb7$ and $DOPa \sim DOPd$ or $DQPa, DQPb$.

Note : 1. A0 and A1 are the two least significant bits(LSB) of the address field and set the internal burst counter if burst is desired.
2. The pin 42 is reserved for address bit for the 16Mb .

FUNCTION DESCRIPTION

The K7A803601A and K7A801801A are synchronous SRAM designed to support the burst address accessing sequence of the Power PC based microprocessor. All inputs (with the exception of $\overline{OE}$, LBO and ZZ) are sampled on rising clock edges. The start and duration of the burst access is controlled by $\overline{ADSC}$, $\overline{ADSP}$ and $\overline{ADV}$ and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with $\overline{ADV}$. When ZZ is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM normally operates after 2cycles of wake up time. ZZ pin is pulled down internally.

Read cycles are initiated with $\overline{ADSP}$ (regardless of $\overline{WEx}$ and $\overline{ADSC}$) using the new external address clocked into the on-chip address register whenever $\overline{ADSP}$ is sampled low, the chip selects are sampled active, and the output buffer is enabled with $\overline{OE}$. In read operation the data of cell array accessed by the current address, registered in the Data-out registers by the positive edge of CLK, are carried to the Data-out buffer by the next positive edge of CLK. The data, registered in the Data-out buffer, are projected to the output pins. $\overline{ADV}$ is ignored on the clock edge that samples $\overline{ADSP}$ asserted, but is sampled on the subsequent clock edges. The address increases internally for the next access of the burst when $\overline{WEx}$ are sampled High and $\overline{ADV}$ is sampled low. And $\overline{ADSP}$ is blocked to control signals by disabling $\overline{CS1}$.

All byte write is done by $\overline{GW}$ (regardless of $\overline{BW}$ and $\overline{WEx}$), and each byte write is performed by the combination of $\overline{BW}$ and $\overline{WEx}$ when $\overline{GW}$ is high.

Write cycles are performed by disabling the output buffers with $\overline{OE}$ and asserting $\overline{WEx}$. $\overline{WEx}$ are ignored on the clock edge that samples $\overline{ADSP}$ low, but are sampled on the subsequent clock edges. The output buffers are disabled when $\overline{WEx}$ are sampled Low (regardless of $\overline{OE}$). Data is clocked into the data input register when $\overline{WEx}$ sampled Low. The address increases internally to the next address of burst, if both $\overline{WEx}$ and $\overline{ADV}$ are sampled Low. Individual byte write cycles are performed by any one or more byte write enable signals ($\overline{WEa}$, $\overline{WEb}$, $\overline{WEc}$ or $\overline{WEd}$) sampled low. The $\overline{WEa}$ control DQa0 ~ DQa7 and DQPa, $\overline{WEb}$ controls DQb0 ~ DQb7 and DQPb, $\overline{WEc}$ controls DQc0 ~ DQc7 and DQPc, and $\overline{WEd}$ control DQd0 ~ DQd7 and DQPd. Read or write cycle may also be initiated with $\overline{ADSC}$, instead of $\overline{ADSP}$. The differences between cycles initiated with $\overline{ADSC}$ and $\overline{ADSP}$ as are follows;

$\overline{ADSP}$ must be sampled high when $\overline{ADSC}$ is sampled low to initiate a cycle with $\overline{ADSC}$.

$\overline{WEx}$ are sampled on the same clock edge that sampled $\overline{ADSC}$ low (and $\overline{ADSP}$ high).

Addresses are generated for the burst access as shown below. The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the LBO pin. When this pin is Low, linear burst sequence is selected. When this pin is High, Interleaved burst sequence is selected.

BURST SEQUENCE TABLE

(Interleaved Burst)

$\overline{LBO}$ PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	0	0	1	1	1	0
		1	0	1	1	0	0	0	1
	Fourth Address	1	1	1	0	0	1	0	0

(Linear Burst)

$\overline{LBO}$ PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	1	0	1	1	0	0
		1	0	1	1	0	0	0	1
	Fourth Address	1	1	0	0	0	1	1	0

Note : 1. LBO pin must be tied to High or Low, and Floating State must not be allowed.

ASYNCHRONOUS TRUTH TABLE

OPERATION	ZZ	$\overline{OE}$	I/O Status
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

Notes

1. X means "Don't Care".
2. ZZ pin is pulled down internally.
3. For write cycles that following read cycles, the output buffers must be disabled with $\overline{OE}$, otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

TRUTH TABLES

SYNCHRONOUS TRUTH TABLE

$\overline{CS}_1$	$\overline{CS}_2$	$\overline{CS}_2$	$\overline{ADSP}$	$\overline{ADSC}$	$\overline{ADV}$	$\overline{WRITE}$	CLK	ADDRESS ACCESSED	OPERATION
H	X	X	X	L	X	X	↑	N/A	Not Selected
L	L	X	L	X	X	X	↑	N/A	Not Selected

X	X	X	H	H	H	L	↑	Current Address	Suspend Burst Write Cycle
H	X	X	X	H	H	L	↑	Current Address	Suspend Burst Write Cycle

- Notes :** 1. X means "Don't Care". 2. The rising edge of clock is symbolized by ↑.
3. $\overline{WRITE}$ = L means Write operation in WRITE TRUTH TABLE.
 $\overline{WRITE}$ = H means Read operation in WRITE TRUTH TABLE.
4. Operation finally depends on status of asynchronous input pins(ZZ and $\overline{OE}$).

WRITE TRUTH TABLE(x36)

$\overline{GW}$	$\overline{BW}$	$\overline{WEa}$	$\overline{WEb}$	$\overline{WEc}$	$\overline{WEd}$	OPERATION
H	H	X	X	X	X	READ
H	L	H	H	H	H	READ
H	L	L	H	H	H	WRITE BYTE a

ZZ Low to Power Up	tPUS	2	-	2	-	2	-	2	-	2	-	cycle

Notes : 1. All address inputs must meet the specified setup and hold times for all rising clock edges whenever ADSC and/or ADSP is sampled low and CS is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
2. Both chip selects must be active whenever ADSC or ADSP is sampled low in order for the this device to remain enabled.
3. ADSC or ADSP must not be asserted for at least 2 Clock after leaving ZZ state.
4. At any given voltage and temperature, tHZC is less than tLZC
