

EQUALIZER AMPLIFIER WITH ALC

The KA2220 is a monolithic integrated circuit consisting of a preamplifier and ALC circuit for cassette tape recorders

FEATURES

- Low noise amplifier.
- Wide operating supply voltage range: $V_{CC} = 3.5V \sim 14V$
- High output voltage.
- Low distortion.
- Wide ALC range.
- KA2220 ST: Good ALC pair characteristic for stereo tape recorders

External Components (Refer to test circuits)

C₁: Input coupling capacitor

The recommended value is 10 μ F. If made too small the low frequency characteristics will change for the worse, and too large a capacitance value will increase the resting time when power is applied.

C₂: Bypass capacitor

Short emitter resistor on the AC and prevents an AC signal from feedback to input.

C₃, R₁, R₂: Equalizer network

The closed loop voltage gain is determined by these components in relation to the internal resistance at Pin 3.

C₄: Output coupling capacitor

C₄ is determined as follows:

$$C_4 = \frac{1}{2\pi \cdot f_L \cdot R_L}$$

f_L : low cut-off frequency

R_L : load resistance

C₅: Phase compensation capacitor.

Prevents high frequency oscillation by phase error when feedback is heavy.

C₆: Ripple filter for power supply

A large value is required to get an excellent ripple characteristic under the line operation, but must be made smaller to shorten the starting time.

R₃: Filter resistance.

R₄: Collector resistor of first stage transistor of the IC

Low voltage characteristic can be improved by adjusting this resistance.

ALC GRADE BINNING TEST CIRCUIT

Fig. 3

Test condition: SG output level should be adjusted to be 13.8mV of the AC voltmeter reading (V_B) when the D.U.T is not connected from the test circuit ($V_{CC}=5V$, $V_A=1.16V$, $T_a=25^\circ C$)

ALC RANK is defined as $ALC-G.R=20\log V_{B2}/V_{B1}$

where

V_{B1} : AC voltmeter reading when the D.U.T is not connected

V_{B2} : AC voltmeter reading when the D.U.T is connected
