

## Low-Current Superhet Remote Control Receiver

### Description

The U4311B is a monolithic integrated circuit in bipolar technology for low-current UHF remote control super-heterodyne receivers in amplitude- or frequency-modulated mode. Typical applications are keyless car

lock-, alarm- or tele-control remote indication systems. Especially for automotive applications, it supports a superhet design with about 1 mA total current consumption as required by the car manufacturers.

### Features

- Usable for amplitude- and frequency-modulated transmission systems
- Extremely low quiescent current (approximately 1 mA in standby mode due to wake-up concept)
- Wide power supply voltage range 3 to 13 V
- Sensitive IF amplifier for 10.7-MHz operating frequency
- Logarithmic AM demodulator
- FM demodulator
- Monoflop exit to wake up a microcontroller
- High-performance operational amplifier to realize a data recovering filter
- Non-inverting clamping comparator with amplitude-dependent hysteresis for data regeneration

### Ordering Information

| Extended Type Number | Package | Remarks |
|----------------------|---------|---------|
| U4311B-M             | DIP16   |         |
| U4311B-MFL           | SO16L   |         |

## Pin Description

| Pin | Symbol              | Function                        |
|-----|---------------------|---------------------------------|
| 1   | OP <sub>in+</sub>   | OP amplifier non-inverted input |
| 2   | OP <sub>out</sub>   | OP amplifier output             |
| 3   | RC <sub>wake</sub>  | RC wake-up reset time           |
| 4   | GND2                | Ground of the logical circuits  |
| 5   | Comp <sub>out</sub> | Comparator output               |
| 6   | RC <sub>-</sub>     | Comparator time constant        |
| 7   | RC <sub>+</sub>     | Comparator time constant        |
| 8   | AM <sub>out</sub>   | AM current output               |
| 9   | IF <sub>in</sub>    | IF input                        |
| 10  | SW <sub>out</sub>   | Wake-up output                  |
| 11  | GND1                | Ground of the analog circuits   |
| 12  | Discr               | FM discriminator tank           |
| 13  | V <sub>Ref</sub>    | Reference voltage               |
| 14  | FM <sub>out</sub>   | FM discriminator output         |
| 15  | V <sub>S</sub>      | Supply voltage                  |
| 16  | OP <sub>in-</sub>   | OP amplifier inverted input     |

1) Measured at Pin 9, referred to 330  $\Omega$

2) Protected by a Z-diode, see figure 13

3) Valid for  $0.1\text{ }\mu\text{F} \leq C_{\text{WU}} \leq 10\text{ }\mu\text{F}$  and  $22\text{ k}\Omega \leq R_{\text{WU}} \leq 680\text{ k}\Omega$

## Circuit Description

### General Functions

The integrated circuit U4311B includes the following functions: IF amplifier, FM demodulator, wake-up circuit with monoflop, operational amplifier, non-inverting data comparator and voltage regulator.

The 10.7-MHz IF signal from the front end passes the integrated IF-amplifier which operates for amplitude- or frequency-modulated signals to either a logarithmic AM demodulator which was implemented to avoid settling-time problems effected by use of an automatic gain control system or a quadrature detector for FM. A data-shaping filter – advantageously realized with the internal high-performance operational amplifier – reduces system bandwidth to an optimized compromise regarding transmission distance and data recognition. Thus, an optimal bit-error rate can be achieved without any further active component.

The comparator connected to the output of the filter has a level-dependent hysteresis and clamps its reference voltage to the signal's minimum and maximum peaks as described later.

Without IF-input signal – in normal mode – only the IF amplifier and the AM demodulator which operates as a

level-strength indicator are activated. If the level of the IF signal increases, the entire circuitry is turned on by the wake-up circuit. This signal is externally available at Pin 10 and can be used to wake up a microcontroller. After an adjustable reset time, determined by the monoflop time constant, the integrated circuit returns to sleep mode. In this case, typically 1-mA supply current is required. An external resistor matched at Pin 3 to ground blocks the wake-up circuit and enables the complete functionality at lower IF levels as can be seen in figures 24 and 27, but supply current increases up to typically 2.8 mA.

### Function of the Clamping Comparator

The output signal of the operational amplifier is fed to the input of the non-inverting comparator and two peak detectors (Q1 and Q2, figure 3). Their time constants are distinguished by RC+ and RC–. The component's value must be adapted to the transmission code. The time constant should be large compared to the bit rate for optimized noise and hum suppression. To compensate the input transistor's base-emitter-voltage differences, these two signals are buffered by Q3 and Q4. The mean value is used as comparator threshold, the difference of the peak values controls the hysteresis. This clamping comparator operates as a data regenerator.

## Data-Recovering Filter

The test circuit in figures 23 and 26 includes an example of a data-recovering filter realized with the components  $R_1$ ,  $R_2$ ,  $C_1$ ,  $C_2$ ,  $C_3$ . It is of a second-order Bessel type with lowpass characteristic, a 3-dB cut-off frequency of 2 kHz and an additional highpass characteristic for suppressing dc and low-frequency ac components. Simulation of time domain and frequency response can be seen in figures 20 and 22. This filter gives a typical application of a 1-kBaud Manchester-code, amplitude-modulated transmission.

The capacitor  $C_2$  is responsible for the highpass cut-off frequency. In order to achieve a correct pulse response, this highpass cut-off frequency should be as low as possible. Figure 20 shows the transient response and the influence of the dc component. The first pulses might be wrong if the highpass cut-off frequency is too low. For this reason, some burst bits must be transmitted before the real data transmission starts. On the other hand, if the cut-off frequency is too high, roof shaping of the rectangle pulses at the operational amplifier output might causes problems.

The lowpass cut-off frequency and the maximum trans-impedance  $V_{out}/I_{in}$  are distinguished by the further external elements. Careful design of the data filter enables optimized transmission range. For designing other filter parameters, please refer to filter design handbooks/ programs or request Atmel Wireless & Microcontrollers for support.

## Application

The U4311B is well-suited to implement UHF remote control or data transmission systems, based on a low-current superheterodyne receiver concept. SAW-devices may be used in the transmitter's as well as in the receiver local oscillator. The front end should be a discrete circuit application with low-current UHF transistors such as S822T or S852T (Vishay Telefunken). The frequency of the local oscillator can be determined either by coaxial resonators or SAW devices. Due to large

SAW-resonator tolerance, an IF bandwidth – and in a FM system additionally the discriminator amplitude characteristic (figure 28) – of 300 kHz or higher is proposed. As the circuit needs only 3.0 V supply voltage for operation, the front end may be a stacked design in order to achieve a total receiver current consumption of approximately 1 mA. Figure 29 shows a principle receiver concept diagram.

## Ozone Depleting Substances Policy Statement

It is the policy of **Atmel Germany GmbH** to

1. Meet all present and future national and international statutory requirements.
2. Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

**Atmel Germany GmbH** has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA
3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

**Atmel Germany GmbH** can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.

**We reserve the right to make changes to improve technical design and may do so without further notice.**

Parameters can vary in different applications. All operating parameters must be validated for each customer application by the customer. Should the buyer use Atmel Wireless & Microcontrollers products for any unintended or unauthorized application, the buyer shall indemnify Atmel Wireless & Microcontrollers against all claims, costs, damages, and expenses, arising out of, directly or indirectly, any claim of personal damage, injury or death associated with such unintended or unauthorized use.
