- Power conservation
- Capacitance reduction and isolation
- Applications requiring Low resistance and active High enabling
- Bus isolation

DESCRIPTION:

The QS32XR862 provides two sets of ten high-speed CMOS, TTL-compatible, active high, low resistance bus switches. The very low ON resistance (2.5Ω) of the QS32XR862 allows inputs to be connected to outputs without adding propagation delay and without generating additional ground bounce noise. The switches are controlled by independent active Low Enable ($\overline{BE}$) and active High Enable (BE) controls for each set.

The QS32XR862 is ideal for switching digital buses as well as for hot plug buffering and 5V to 3.3V conversion. The low ON resistance of the QS32XR862 makes it ideal for PCI hot-docking applications.

The QS32XR862 is characterized for operation at -40°C to $+85^{\circ}\text{C}$.

POWER SUPPLY CHARACTERISTICS

Symbol	Parameter	Test Conditions ⁽¹⁾	Typ. ⁽²⁾	Max.	Unit
I _{ccQ}	Quiescent Power Supply Current	V _{CC} = Max., BEn = GND or V _{CC} , f = 0	0.2	6	μA
ΔI _{CC}	Power Supply Current per Control Input HIGH ⁽³⁾	V _{CC} = Max., V _{IN} = 3.4V, f = 0	—	2.5	mA
I _{CCD}	Dynamic Power Supply Current per MHz ⁽⁴⁾	V _{CC} = Max., A and B pins open Control Inputs Toggling at 50% Duty Cycle	—	0.25	mA/MHz

NOTES:

- For conditions shown as Min. or Max., use the appropriate values specified under DC Electrical Characteristics.
- Typical values are at V_{CC} = 5.0V, T_A = 25°C.
- Per TLL driven input (V_{IN} = 3.4V, control inputs only). A and B pins do not contribute to ΔI_{CC}.
- This current applies to the control inputs only and represents the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is guaranteed but not production tested.

SWITCHING CHARACTERISTICS OVER OPERATING RANGE

T_A = -40°C to +85°C, V_{CC} = 5.0V ± 10%

C_{LOAD} = 50pF, R_{LOAD} = 500Ω unless otherwise noted.

Symbol	Parameter	Min. ⁽¹⁾	Typ.	Max.	Unit
t _{PLH} t _{PHL}	Data Propagation Delay ^(2,3) A _n to/from B _n	—	—	0.12	ns
t _{PZL} t _{PZH}	Switch Turn-on Delay BEn or BEn to A _n /B _n	1.5	—	5.6	ns
t _{PLZ} t _{PHZ}	Switch Turn-off Delay ⁽²⁾ BEn to A _n /B _n	1.5	—	4.5	ns

NOTES:

- Minimums are guaranteed but not production tested.
- This parameter is guaranteed but not production tested.
- The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.12ns for C_L = 50pF. Since this time constant is much smaller than the rise and fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
