TIMING DIAGRAM

READ CYCLE 1(Note 1,4)

READ CYCLE 2(Note 1,2,4)

READ CYCLE 3(Note 1,2,4)

Notes:

1. Read Cycle occurs whenever a high on the /WE and /OE is low, while /UB and/or /LB and /CS1 and CS2 are in active status.
2. /OE = V_{IL}
3. Transition is measured $\pm 200\text{mV}$ from steady state voltage.
This parameter is sampled and not 100% tested.
4. /CS1 in high for the standby, low for active
CS2 in low for the standby, high for active. /UB and /LB in high for the standby, low for active

WRITE CYCLE 1 (1,4,8) (/WE Controlled)

WRITE CYCLE 2 (Note 1,4,8) (/CS1, CS2 Controlled)

Notes:

1. A write occurs during the overlap of a low /WE, a low /CS1, a high CS2 and a low /UB and/or /LB .
2. tWR is measured from the earlier of /CS1, /LB, /UB, or /WE going high or CS2 going low to the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the output must not be applied.
4. If the /CS1, /LB and /UB low transition and CS2 high transition occur simultaneously with the /WE low transition or after the /WE transition, outputs remain in a high impedance state.
5. Q(data out) is the same phase with the write data of this write cycle.
6. Q(data out) is the read data of the next address.
7. Transition is measured $\pm 200\text{mV}$ from steady state.
This parameter is sampled and not 100% tested.
8. /CS1 in high for the standby, low for active
CS2 in low for the standby, high for active.
/UB and /LB in high for the standby, low for active
