

DDR Phase Lock Loop Clock Driver

Recommended Application:

DDR Clock Driver

Product Description/Features:

- Low skew, low jitter PLL clock driver
- I²C for functional and output control
- Feedback pins for input to output synchronization
- Spread Spectrum tolerant inputs
- With bypass mode mux
- Operating frequency 60 to 140 MHz

Switching Characteristics:

- PEAK - PEAK jitter (66MHz): <120ps
- PEAK - PEAK jitter (>100MHz): <75ps
- CYCLE - CYCLE jitter (66MHz): <120ps
- CYCLE - CYCLE jitter (>100MHz): <65ps
- OUTPUT - OUTPUT skew: <100ps
- Slew Rate: 1V/ns - 2V/ns

Pin Configuration

48-Pin TSSOP

4, 11, 21, 28, 34, 38, 45,	VDD	PWR	Power supply 2.5V
12	SCLK	IN	Clock input of I ² C input, 5V tolerant input
13	CLK_INT	IN	"True" reference clock input
14	CLK_INC	IN	"Complementary" reference clock input
15	VDDI ² C	PWR	3.3V power for I ² C
16	AVDD	PWR	Analog power supply, 2.5V
17	AGND	PWR	Analog ground.
32	FB_OUTC	OUT	"Complementary" Feedback output, dedicated for external feedback. It switches at the same frequency as the CLK. This output must be wired to FB_INC.
33	FB_OUTT	OUT	"True" " Feedback output, dedicated for external feedback. It switches at the same frequency as the CLK. This output must be wired to FB_INT.
35	FB_INT	IN	"True" Feedback input, provides feedback signal to the internal PLL for synchronization with CLK_INT to eliminate phase error.
36	FB_INC	IN	"Complementary" Feedback input, provides signal to the internal PLL for synchronization with CLK_INC to eliminate phase error.
37	SDATA	IN	Data input for I ² C serial input, 5V tolerant input

Absolute Maximum Ratings

Supply Voltage: (VDD & AVDD) -0.5V to 3.6V
 (VDDI) -0.5V to 4.6V
 Logic Inputs: VI (except SCLK and SDATA) -0.5 V to VDD +0.5 V
 VI (SCLK and SDATA) -0.5 V to VDDI2C +0.5 V
 Logic Outputs: VO (except SDATA) -0.5 V to VDD +0.5 V
 VO (SDATA) -0.5 V to VDDI2C +0.5 V
 Input clamp current: IIK (VI < 0 or VI > VDD) +/- 50mA
 Output clamp current: IOK (VO < 0 or VO > VDD) +/- 50mA
 Continuous output current: IO (VO = 0 to VDD) .. +/- 50mA
 Package thermal impedance, theta JA: DGG package +89°C/W
 Storage Temperature -65°C to +150°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Notes:

- Refers to transition on noninverting output.
- While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: duty cycle=t_{WH}/t_c, were the cycle (t_c) decreases as the frequency goes up.

General I²C serial interface information

The information in this section assumes familiarity with I²C programming.
For more information, contact ICS for an I²C programming application note.

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2_(H)
- ICS clock will **acknowledge**
- Controller (host) sends a dummy command code
- ICS clock will **acknowledge**
- Controller (host) sends a dummy byte count
- ICS clock will **acknowledge**
- Controller (host) starts sending first byte (Byte 0) through byte 5
- ICS clock will **acknowledge** each byte **one at a time**.
- Controller (host) sends a Stop bit

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the read address D3_(H)
- ICS clock will **acknowledge**
- ICS clock will send the **byte count**
- Controller (host) acknowledges
- ICS clock sends first byte (**Byte 0**) through **byte 5**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

Notes:

1. The ICS clock generator is a slave/receiver, I²C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol.**
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I²C interface, the protocol is set to use only **"Block-Writes"** from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

Recommended Layout for the ICS93V850

General Layout Precautions:

Use copper flooded ground on the top signal layer under the clock buffer. The area under U1 on the right is an example. Flood over the ground vias.

- 1) Use power vias for power and ground. Vias 20 mil or larger in diameter have lower high frequency impedance. Vias for signals may be minimum drill size.
- 2) Make all power and ground traces are as wide as the via pad for lower inductance.
- 3) VAA for pin 16 has a low pass RC filter to decouple the digital and analog supplies. The 4.7uF capacitors may be replaced with a single low ESR device with the same total capacitance. VAA is routed on a outside signal layer. Do not cut a power or ground plane and route in it.
- 4) Notice that ground vias are never shared.
- 5) When ever possible, VCC (net V2P5 in the schematic) pins have a decoupling capacitor. Power is always routed from the plane connection via to the capacitor pad to the VCC pin on the clock buffer. Moats or plane cuts are not used to isolate power.
- 6) Differential mode clock output traces are routed:
 - a. With a ground trace between the pairs. Trace is grounded on both ends.
 - b. Without a ground trace, clock pairs are routed with a separation of at least 5 times the thickness of the dielectric. If the dielectric thickness is 4.5 mil, the trace separation is at least 18 mils.
- 7) Terminate differential CLK_IN and FB_IN traces after routing to buffer pads.
