MAX1875 Evaluation Kit

General Description

The MAX1875 evaluation kit (EV kit) demonstrates a low-cost application circuit. This dual-PWM synchronous DC-to-DC converter operates from unregulated AC adapters and generates precision, low-voltage rails for broadband gateways, digital TVs, cable modems, and set-top boxes.

The MAX1875 EV kit provides dual 1.8V and 3.3V output voltages from an 8V to 18V input voltage range. It delivers up to 3.5A output current for the 1.8V output and the 3.3V output, with greater than 90% efficiency. Both converters operate 180 degrees out-of-phase to reduce input ripple current. The EV kit operates at 100kHz switching frequency.

This EV kit is a fully assembled and tested circuit board. It also allows evaluation of other output voltages in the 0.75V to 15V range.

The MAX1875 EV kit can also be used to evaluate the MAX1876 and MAX1858.

Features

- ◆ 8V to 18V Input Voltage Range
- ◆ 1.8V and 3.3V Adjustable Output Voltages
- ◆ 3.5A Output Current (1.8V Output)
- ◆ 3.5A Output Current (3.3V Output)
- ◆ Lossless Foldback Current Limit
- ◆ 100kHz Switching Frequency
- ◆ RST Output with 140ms Delay (MAX1876/MAX1858 only)
- ◆ 180 Degree Out-of-Phase Operation
- ◆ 24-Pin QSOP Package
- ◆ Low-Cost Components
- ◆ Fully Assembled and Tested

Quick Start

Before beginning, the following equipment is required:

- 8V to 18V power supply
- Electronic loads capable of sinking 3.5A each
- Digital multimeters (DMMs)
- 100MHz dual-trace oscilloscope

Follow these steps to verify board operation. **Do not turn on the power supply until all connections are completed:**

- 1) Ensure that the circuit is connected correctly to the supply and electronic loads before applying any power. Set electronic loads in resistive mode.
- 2) Verify that the shunts are across JU1 pins 1 and 2 as well as JU2 pins 2 and 3.
- 3) Turn on power supply.
- 4) Verify that the output voltages are 1.8V and 3.3V.

Evaluating Other Output Voltages

The EV kit outputs are programmed for 1.8V and 3.3V. However, the output voltages can also be adjusted between 1V and 15V by selecting R1/R2 and R3/R4 values. Select the feedback resistors R2 and R4. R1 and R3 are then given by:

$$R1 \text{ (or } R3) = R2 \text{ (or } R4) \times [(V_{OUT} / V_{FB}) - 1]$$

where $V_{FB} = 1V$. Refer to the MAX1875 data sheet for selection of output capacitors, inductors, and compensation networks.

Evaluating the MAX1876 and MAX1858

Replace U1 with the MAX1876/MAX1858.

Jumper Settings

Table 1. Jumper JU1 Functions (EN Mode Selection)

JU1	EN PIN	MAX1875 OUTPUT
1 and 2	Connected to VL	MAX1875 enabled, $V_{OUT1} = 1.8V$, $V_{OUT2} = 3.3V$
2 and 3	Connected to GND	Shutdown mode, $V_{OUT1} = 0V$, $V_{OUT2} = 0V$
Not Installed	Connected to EN pad	MAX1875 must be enabled by an external signal

Table 2. Jumper JU2 Functions (SYNC Mode Selection)

JU2	SYNC PIN	EFFECT
1 and 2	Connected to VL	Used to sync up an additional MAX1875. CKO is 2x DH1 and phase shifted by 90 degrees.
2 and 3	Connected to GND	Used to sync up an additional single buck. CKO is the same frequency and phase as DH1.
Not Installed	Connected to SYNC pad	External clock is applied to SYNC input (200kHz typ)
