

MAX1954A Evaluation Kit

General Description

The MAX1954A evaluation kit (EV kit) demonstrates the MAX1954A buck controller application circuit. The EV kit generates a 1.5V output voltage at load currents up to 5A from a 10.8V to 13.2V input voltage range independent of the IC supply voltage. The MAX1954A switches at 300kHz and has better than 90% efficiency with the supplied components.

The EV kit comes fully assembled and tested.

Features

- ◆ **Current-Mode Controller**
- ◆ **300kHz Fixed-Frequency PWM**
- ◆ **0.8V Minimum Output Voltage**
- ◆ **10.8V to 13.2V Input Voltage Range**
- ◆ **>90% Efficiency**
- ◆ **Output Shutdown Mode**
- ◆ **All n-Channel MOSFET Design for Low Cost**
- ◆ **No Current-Sense Resistor Needed**
- ◆ **Foldback Short-Circuit Protection**
- ◆ **Thermal-Overload Protection**
- ◆ **Small 10-Pin μ MAX[®] Package**
- ◆ **Assembled and Tested**

Recommended Equipment

- 15V at 1A DC variable power supply
- 5V at 100mA power supply
- Digital multimeter (DMM)
- 5A load
- Ammeter (optional)

Quick Start

The MAX1954A application circuit is fully assembled and tested. Follow these steps to verify board operation:

- 1) Preset the DC power supplies to 12V and 5V. Turn off the power supplies. **Do not turn on the power supplies until all connections are complete.**
- 2) Remove the shunt from JU1 and JU2.
- 3) Connect the positive lead of the 5V power supply to the VIN pad on the EV kit and connect the negative lead of the power supply to the GND pad on the EV kit.
- 4) Connect the positive lead of the 12V power supply to the VHSD pad on the EV kit and connect the negative lead of the power supply to the GND pad on the EV kit.
- 5) Connect the positive lead of the DMM to the VOUT pad on the EV kit and connect the negative lead of the DMM to the GND pad on the EV kit.
- 6) Turn on the power supplies.
- 7) Verify that the voltage at VOUT is 1.5V \pm 2.5%.
- 8) Connect a 5A load between VOUT and GND.
- 9) Verify that the voltage at VOUT is 1.5V \pm 2.5%.

Detailed Description

Evaluating Other Output Voltages

The MAX1954A EV kit comes preset to a 1.5V output voltage. The output of the MAX1954A is adjustable down to 0.8V. To adjust the output voltage, place a 1% resistor at R1 with a value corresponding to the equation:

$$R1 = 8.06 \times 10^3 \times ((V_{OUT} / 0.8) - 1)$$

Note that V_{OUT} cannot exceed V_{IN} and is limited by the maximum duty cycle of the MAX1954A.

Refer to the MAX1954A data sheet for information on selecting output inductor, capacitor, and compensation components to optimize the circuit for different output voltages.

Using a Single Power Supply

If the input source is between 3V to 5.5V, install a shunt on JU1 (to connect VSHD and VIN), and connect the power supply between the VHSD pad and the GND pad on the EV kit. Refer to the MAX1954A data sheet for information on selecting the inductor, capacitors, and compensation components for optimum performance.

Jumper Settings

Jumper JU1 Function (HSD Control)

Connect HSD to IN when using input voltages lower than 5.5V. Place a shunt on JU1 to connect HSD to IN.

Jumper JU2 Function (Output Shutdown Mode)

The MAX1954A features an output shutdown mode to minimize the quiescent current. To shut down the output, place a shunt between pins 1 and 2 on JU2. For normal operation remove the shunt from JU2.
