

Precision, 8-Channel/Dual 4-Channel, Low-Voltage, CMOS Analog Multiplexers

General Description

The MAX398/MAX399 precision, monolithic, CMOS analog multiplexers (muxes) offer low on-resistance (less than 100Ω), which is matched to within 6Ω between channels and remains flat over the specified analog signal range (11Ω max). They also offer low leakage over temperature (NO-off leakage current less than $2.5nA$ at $+85^\circ C$) and fast switching speeds (transition time less than 250ns). The MAX398 is an 8-channel device, and the MAX399 is a dual 4-channel device.

The MAX398/MAX399 are fabricated with Maxim's low-voltage silicon-gate process. Design improvements yield extremely low charge injection (less than $5pC$) and guarantee electrostatic discharge protection greater than 2000V.

These muxes operate with a single $+3V$ to $+15V$ supply or bipolar $\pm 3V$ to $\pm 8V$ supplies, while retaining CMOS-logic input compatibility and fast switching. CMOS inputs provide reduced input loading. The MAX398/MAX399 are pin compatible with the industry-standard DG408, DG409, DG508A, and DG509A.

Applications

- Sample-and-Hold Circuits
- Automatic Test Equipment
- Heads-Up Displays
- Guidance and Control Systems
- Military Radios
- Communications Systems
- Battery-Operated Systems
- PBX, PABX
- Audio Signal Routing
- Low-Voltage Data Acquisition Systems

Features

- ♦ Pin Compatible with Industry-Standard DG408/DG409/DG508A/DG509A
- ♦ Guaranteed On-Resistance Match Between Channels ($<6\Omega$)
- ♦ Low On-Resistance ($<100\Omega$)
- ♦ Guaranteed Flat On-Resistance over Signal Range ($<11\Omega$)
- ♦ Guaranteed Low Charge Injection ($<5pC$)
- ♦ NO-Off Leakage Current $<1nA$ at $+85^\circ C$
- ♦ COM-Off Leakage Current $<2.5nA$ at $+85^\circ C$
- ♦ Electrostatic Discharge Protection $>2000V$
- ♦ Single-Supply Operation ($+3V$ to $+15V$) Bipolar-Supply Operation ($\pm 3V$ to $\pm 8V$)
- ♦ Low Power Consumption ($<300\mu W$)
- ♦ Rail-to-Rail Signal Handling
- ♦ TTL/CMOS-Logic Compatible

MAX398/MAX399

Precision, 8-Channel/Dual 4-Channel, Low-Voltage, CMOS Analog Multiplexers

ABSOLUTE MAXIMUM RATINGS

Voltage Referenced to GND		
V+	-0.3V to +17V
V-	+0.3V to -17V
V+ to V-	-0.3V to +17V
Voltage into Any Terminal (Note 1).....(V- - 2V) to (V+ + 2V) or 30mA (whichever occurs first)		
Current into Any Terminal	30mA
Peak Current, Any Terminal (pulsed at 1ms, 10% duty cycle max)	40mA
Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)		
Plastic DIP (derate 7.5mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	470mW
Narrow SO (derate 8.7mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	696mW
CERDIP (derate 10.0mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	900mW
Operating Temperature Ranges		
MAX39_C_.....	0°C to $+70^\circ\text{C}$
MAX39_E_.....	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
MAX39_MJE	-55 $^\circ\text{C}$ to +125 $^\circ\text{C}$
Storage Temperature Range	-65 $^\circ\text{C}$ to +150 $^\circ\text{C}$
Lead Temperature (soldering, 10sec)	+300 $^\circ\text{C}$

Note 1: Signals on any terminal exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: $\Delta R_{ON} = R_{ONMAX} - R_{ONMIN}$.

Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges, i.e., $V_{NO} = 3V$ to $0V$ and $0V$ to $-3V$.

Note 6: Leakage parameters are 100% tested at maximum rated hot operating temperature, and guaranteed by correlation at $+25^\circ C$.

Note 7: Worst-case isolation is on channel 4 because of its proximity to the COM pin. Off isolation = $20\log \frac{V_{COM}}{V_{NO}}$, V_{COM} = output, V_{NO} = input to off switch.

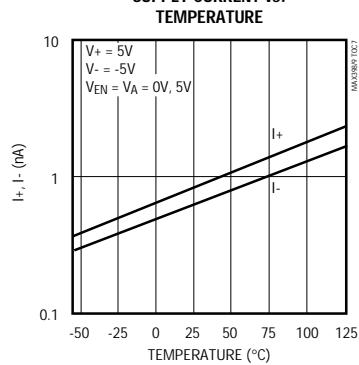

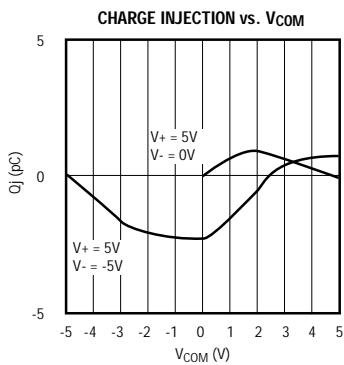

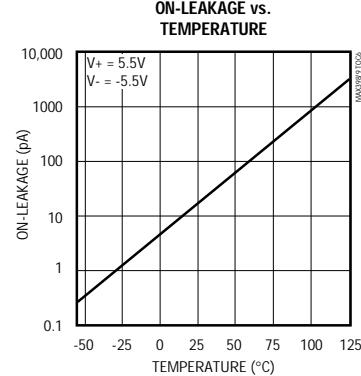

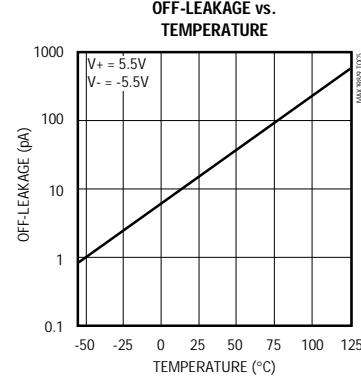

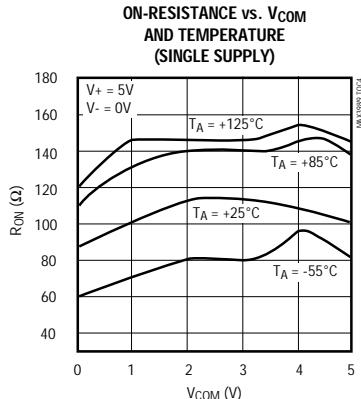

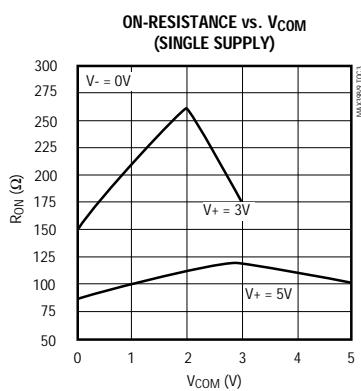

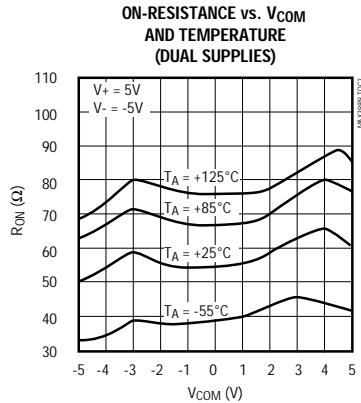

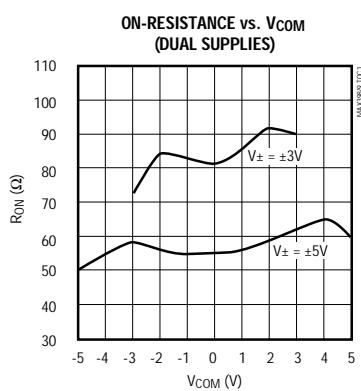

Note 8: Leakage testing at single supply is guaranteed by correlation testing with dual supplies.

Precision, 8-Channel/Dual 4-Channel, Low-Voltage, CMOS Analog Multiplexers

Applications Information

Operation with Supply Voltages Other than $\pm 5V$

Using supply voltages less than $\pm 5V$ reduces the analog signal range. The MAX398/MAX399 muxes operate with $\pm 3V$ to $\pm 8V$ bipolar supplies or with a $+3V$ to $+15V$ single supply. Connect V- to GND when operating with a single supply. Both device types can also operate with unbalanced supplies, such as $+10V$ and $-5V$. The *Typical Operating Characteristics* graphs show typical on-resistance with $\pm 3V$, $\pm 5V$, $+3V$ and $+5V$ supplies. (Switching times increase by a factor of two or more for operation at $5V$.)

Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings, because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence V+ on first, then V-, followed by the logic inputs, NO, or COM. If power-supply sequencing is not possible, add two small signal diodes (D1, D2) in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog signal range to one diode drop below V+ and one diode drop

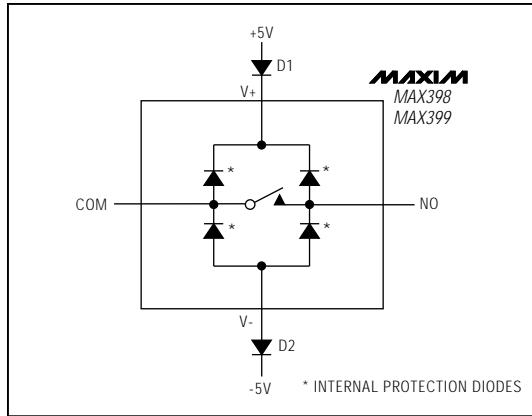

Figure 1. Overvoltage Protection Using External Blocking Diodes

above V-, but does not affect the devices' low switch resistance and low leakage characteristics. Device operation is unchanged, and the difference between V+ and V- should not exceed 17V. These protection diodes are not recommended when using a single supply.
