

CD4051B-Q1, CD4052B-Q1, CD4053B-Q1 CMOS ANALOG MULTIPLEXERS/DEMULPLEXERS WITH LOGIC-LEVEL CONVERSION

SCHS354 – AUGUST 2004

Features

- Qualification in Accordance With AEC-Q100†
- Qualified for Automotive Applications
- Customer-Specific Configuration Control Can Be Supported Along With Major-Change Approval
- Wide Range of Digital and Analog Signal Levels
 - Digital: 3 V to 20 V
 - Analog: $\leq 20 V_{P-P}$
- Low ON Resistance, 125 Ω (Typ) Over 15 V_{P-P} Signal Input Range for $V_{DD} - V_{EE} = 18 V$
- High OFF Resistance, Channel Leakage of $\pm 100 pA$ (Typ) at $V_{DD} - V_{EE} = 18 V$
- Logic-Level Conversion for Digital Addressing Signals of 3 V to 20 V ($V_{DD} - V_{SS} = 3 V$ to 20 V) to Switch Analog Signals to 20 V_{P-P} ($V_{DD} - V_{EE} = 20 V$)

† Contact factory for details. Q100 qualification data available on request.

- Matched Switching Characteristics, $r_{on} = 5 \Omega$ (Typ) for $V_{DD} - V_{EE} = 15 V$
- Very Low Quiescent Power Dissipation Under All Digital-Control Input and Supply Conditions, 0.2 μW (Typ) at $V_{DD} - V_{SS} = V_{DD} - V_{EE} = 10 V$
- Binary Address Decoding on Chip
- 5-V, 10-V, and 15-V Parametric Ratings
- 100% Tested for Quiescent Current at 20 V
- Maximum Input Current of 1 μA at 18 V Over Full Package Temperature Range, 100 nA at 18 V and 25°C
- Break-Before-Make Switching Eliminates Channel Overlap

Applications

- Analog and Digital Multiplexing and Demultiplexing
- Analog-to-Digital (A/D) and Digital-to-Analog (D/A) Conversion
- Signal Gating

description/ordering information

The CD4051B, CD4052B, and CD4053B analog multiplexers are digitally-controlled analog switches that have low ON impedance and very low OFF leakage current. Control of analog signals up to 20 V_{P-P} can be achieved by digital signal amplitudes of 4.5 V to 20 V (If $V_{DD} - V_{SS} = 3 V$, a $V_{DD} - V_{EE}$ of up to 13 V can be controlled; for $V_{DD} - V_{EE}$ level differences above 13 V, a $V_{DD} - V_{SS}$ of at least 4.5 V is required). For example, if $V_{DD} = 4.5 V$, $V_{SS} = 0 V$, and $V_{EE} = -13.5 V$, analog signals from $-13.5 V$ to 4.5 V can be controlled by digital inputs of 0 V to 5 V. These multiplexer circuits dissipate extremely low quiescent power over the full $V_{DD} - V_{SS}$ and $V_{DD} - V_{EE}$ supply-voltage ranges, independent of the logic state of the control signals. When a logic high (H) is present at the inhibit (INH) input, all channels are off.

SCHS354 – AUGUST 2004

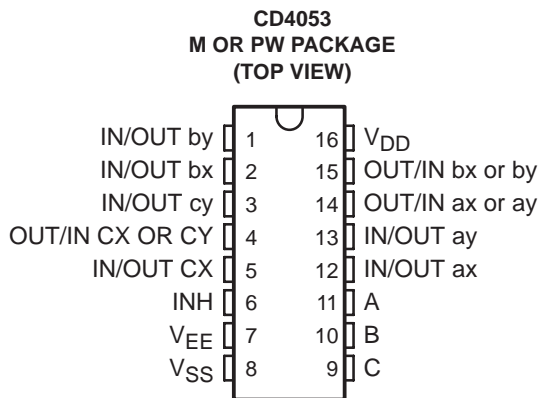

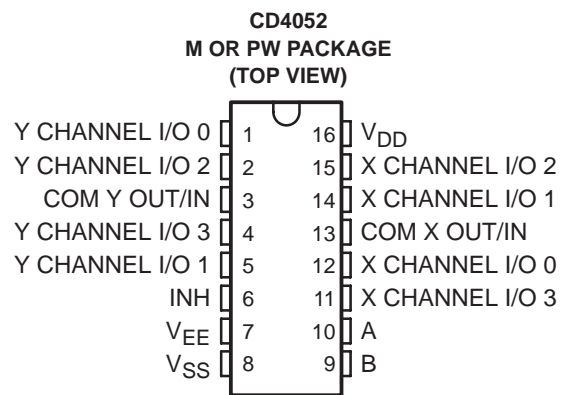

description/ordering information (continued)

The CD4051B is a single eight-channel multiplexer that has three binary control inputs (A, B, and C) and an inhibit input. The three binary signals select one of eight channels to be turned on and connect one of the eight inputs to the output.

The CD4052B is a differential four-channel multiplexer that has two binary control inputs (A and B) and an inhibit input. The two binary input signals select one of four pairs of channels to be turned on and connect the analog inputs to the outputs.

The CD4053B is a triple two-channel multiplexer with three separate digital control inputs (A, B, and C) and an inhibit input. Each control input selects one of a pair of channels, which are connected in a single-pole, double-throw configuration.

When these devices are used as demultiplexers, the CHANNEL IN/OUT terminals are the outputs, and the common (COM OUT/IN) terminals are the inputs.

absolute maximum ratings over operating free-air temperature (unless otherwise noted)‡

Supply voltage range, V+ to V- (voltages referenced to V _{SS} terminal)	-0.5 to 20 V
DC input voltage range	-0.5 V to V _{DD} + 0.5 V
DC input current, any one input	±10 mA
Package thermal impedance, θ_{JA} (see Note 1): M package	73°C/W
PW package	108°C/W
Maximum junction temperature, T _J	150°C
Lead temperature (during soldering):	
At distance 1/16 ± 1/32 inch (1,59 ± 0,79 mm) from case for 10 s max	265°C
Storage temperature range, T _{Stg}	-65°C to 150°C

‡ Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: The package thermal impedance is calculated in accordance with JESD 51-7.

APPLICATION INFORMATION

In applications where separate power sources drive V_{DD} and the signal inputs, the V_{DD} current capability should exceed V_{DD}/R_L (R_L = effective external load). This provision avoids permanent current flow or clamp action on the V_{DD} supply when power is applied or removed from the CD4051B, CD4052B, or CD4053B.
