

- Designed to be Interchangeable With Intel 8224
- Single-Chip Clock Driver With Self-Contained Oscillator
- Specifically Designed to Drive All 8080A Microprocessors

description

This clock generator is capable of driving 12-volt lines. It contains a crystal-controlled oscillator, a divide-by-nine clock phase generator, two high-level drivers, and auxiliary circuitry.

The internal oscillator is designed to operate with fundamental-mode crystals, or with overtone-mode crystals when using a parallel-tuned circuit connected to the tank terminal, pin 13. The oscillator output appears on pin 12 and drives the divide-by-nine counter. The  $\div 9$  clock phase generator output consists of phases  $\phi 2$  for driving MOS inputs and  $\phi 2$  TTL for driving TTL. Three other TTL outputs, status strobe, reset, and ready, are coupled to the divide-by-nine counter. A sync input from the 8080A is AND'ed with  $\phi 1A$  to produce the status strobe. The power-on reset also generates the status strobe signal through an output NOR gate. The reset input works on a voltage-level basis by use of a Schmitt

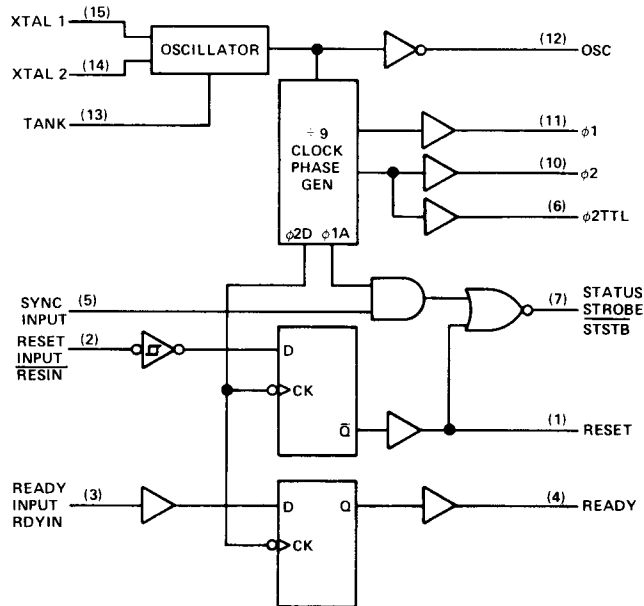

J OR N PACKAGE

trigger. A rising voltage waveform is triggered at a particular voltage. A synchronized ready output is obtained by clocking with a  $\phi 2$  signal.

The SN74LS424 is characterized for operation over the temperature range of 0°C to 70°C.

## TWO-PHASE CLOCK GENERATOR/DRIVER

### TYPICAL APPLICATION DATA

The 'LS424 is a single-chip clock generator/driver for 8080A CPU's, furnishing three clocks ( $\phi 1$ ,  $\phi 2$  and  $\phi 2$  TTL), status strobe, reset, and ready signals. The 'LS424 contains a crystal-controlled oscillator, a divide-by-nine counter, two high-level drivers, and several auxiliary logic functions. Figure 4 is a functional block diagram of the SN74LS424. Figure 5 shows the relationship between  $\phi 1$ ,  $\phi 2$ , and the oscillator frequency period.

#### oscillator

A high order of clock frequency stability is provided by use of an external quartz crystal to set the oscillator frequency which is nine times the operating frequency of the 8080A. The quartz crystal is operated in a series-resonant mode. A fundamental-mode crystal requires no auxiliary circuitry, but an overtone-mode crystal requires an ac-coupled parallel-resonant circuit to be connected to the tank connection (pin 13). The parallel-resonant circuit, tuned to the oscillator frequency, compensates for the lower Q of the overtone-mode crystal. The required size of the circuit components can be calculated from  $f = 1/2\pi\sqrt{LC}$  where f is the oscillator frequency, L is inductance value, and C is capacitance value. Figure 6 shows an ac-coupled parallel-tuned circuit used with the SN74LS424.

#### clock phase generator

The divide-by-nine clock phase generator contains a divide-by-nine counter, logic required to shape the clock pulses as shown under parameter measurement information, gates and flip-flops to generate auxiliary signals, and output drivers. The divide-by-nine counter waveforms are combined with gates to form a  $\phi 1$  pulse with a width of two periods of the oscillator frequency, repeating at intervals of nine oscillator periods. Similarly, the  $\phi 2$  pulse, having a width of five oscillator frequency periods, is formed lagging the  $\phi 1$  pulse by two oscillator periods.

$\phi 1$  and  $\phi 2$  outputs are provided by high-level drivers for direct connection to the 8080A CPU.  $\phi 2$  TTL is derived in a manner similar to  $\phi 1$  and  $\phi 2$ , but the output driver output is at TTL voltage levels. The  $\phi 2$  TTL pulse width is the same as  $\phi 2$ . A  $\phi 2$  TTL application is clocking in direct memory access activities. Figure shows the 'LS424 connected to an 8080A, quartz crystal, and LC circuits.

#### status strobe

The 8080A CPU puts status information on its data bus at the beginning of each machine cycle that defines the nature of the machine operation for that cycle. A sync signal from the 8080A is gated by an internal timing signal ( $\phi 1A$ ) and becomes a status strobe to notify system components that the status data is present on 8080A status output lines. The status strobe signal connects directly to the 'S428 system controller.

The status strobe signal is alternatively generated by the reset input. An external RC series network connected to  $V_{CC}$  and the reset input will provide a rising voltage waveform when  $V_{CC}$  is turned on. An internal Schmitt trigger circuit generates a sharp, fast-rising waveform when the reset input reaches a particular voltage value. The Schmitt trigger is connected to the D input of a flip-flop clocked by  $\phi 2D$ . When power is turned on, the combination of internal and external circuitry will produce a status strobe signal. A manual reset switch can be connected as in figure 6 to the RC network to produce reset and status strobe signals for the 8080A.

The ready signal indicates to the 8080A that an external device has completed transfer of data to or from the data bus. A ready signal input to the 'LS424 drives the D input of a flip-flop clocked by an internal  $\phi 2D$  signal. Timing requirements of the 8080A machine cycle are met by the synchronization with the system clocks provided by the flip-flop. This implementation saves about 200 ns of system time during memory cycles (as contrasted with generating a "wait request" within the 8080A's MOS logic) since the bipolar logic of the 'LS424 has much less delay.

# TYPE SN74LS424 (TIM8224) TWO-PHASE CLOCK GENERATOR/DRIVER

## TYPICAL APPLICATION DATA

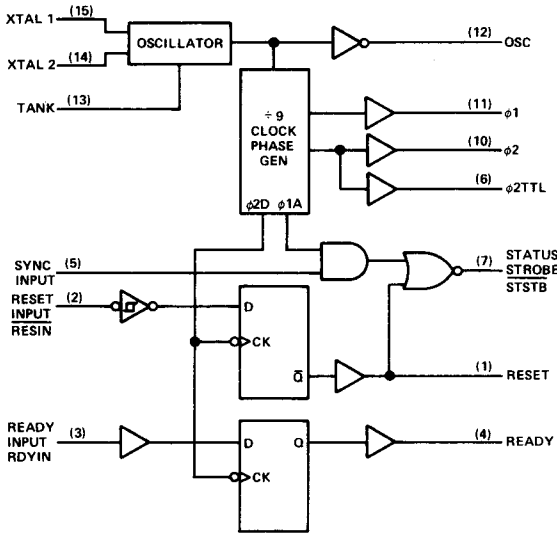

FIGURE 4

Example: 8080A cycle = 450 ns  
 $f_{osc}$ : 20 MHz (unit = 50 ns)  
 $t_w(\phi_1)$  = 100 ns (2 X 50 ns)  
 $t_w(\phi_2)$  = 250 ns (5 X 50 ns)  
 $t_{\phi 2L, \phi 1H}$  = 100 ns (2 X 50 ns)

### CRYSTAL REQUIREMENTS

Frequency tolerance:  $\pm 0.005\%$  for  $0^\circ\text{C}$  to  $70^\circ\text{C}$   
 Resonance Mode: series, fundamental (use 3rd overtone mode with tank circuit)  
 Load capacitance: 20 pF to 35 pF  
 Equivalent resistance: 20  $\Omega$  to 75  $\Omega$   
 Minimum power dissipation: 4 mW
