Very Low Power/Voltage CMOS SRAM
256K X 16 bit

BS616LV4017

■ FEATURES

- Wide Vcc operation voltage : 2.4~5.5V
- Very low power consumption :
  - Vcc = 3.0V C-grade: 26mA (@55ns) operating current
    I-grade: 27mA (@55ns) operating current
    C-grade: 21mA (@70ns) operating current
    I-grade: 22mA (@70ns) operating current
    0.45uA (Typ.) CMOS standby current
  - Vcc = 5.0V C-grade: 63mA (@55ns) operating current
    I-grade: 65mA (@55ns) operating current
    C-grade: 53mA (@70ns) operating current
    I-grade: 55mA (@70ns) operating current
    2.0uA (Typ.) CMOS standby current
- High speed access time :
  - -55 55ns
  - -70 70ns
- Automatic power down when chip is deselected
- Three state outputs and TTL compatible
- Fully static operation
- Data retention supply voltage as low as 1.5V
- Easy expansion with $\overline{CE}$ and $\overline{OE}$ options
- I/O Configuration x8/x16 selectable by $\overline{LB}$ and $\overline{UB}$ pin

■ DESCRIPTION

The BS616LV4017 is a high performance, very low power CMOS Static Random Access Memory organized as 262,144 words by 16 bits and operates from a wide range of 2.4V to 5.5V supply voltage.
Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.45uA at 3.0V/25ºC and maximum access time of 55ns at 3.0V/85ºC.
Easy memory expansion is provided by an active LOW chip enable ($\overline{CE}$) ,active LOW output enable($\overline{OE}$) and three-state output drivers.
The BS616LV4017 has an automatic power down feature, reducing the power consumption significantly when chip is deselected.
The BS616LV4017 is available in DICE form, JEDEC standard 44-pin TSOP Type II package and 48-ball BGA package.

■ PIN DESCRIPTIONS

Name	Function
A0-A17 Address Input	These 18 address inputs select one of the 262,144 x 16-bit words in the RAM.
$\overline{CE}$ Chip Enable Input	$\overline{CE}$ is active LOW. Chip enables must be active when data read from or write to the device. if chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high impedance state when the device is deselected.
$\overline{WE}$ Write Enable Input	The write enable input is active LOW and controls read and write operations. With the chip selected, when $\overline{WE}$ is HIGH and $\overline{OE}$ is LOW, output data will be present on the DQ pins; when $\overline{WE}$ is LOW, the data present on the DQ pins will be written into the selected memory location.
$\overline{OE}$ Output Enable Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when $\overline{OE}$ is inactive.
$\overline{LB}$ and $\overline{UB}$ Data Byte Control Input	Lower byte and upper byte data input/output control pins.
DQ0 - DQ15 Data Input/Output Ports	These 16 bi-directional ports are used to read data from or write data into the RAM.

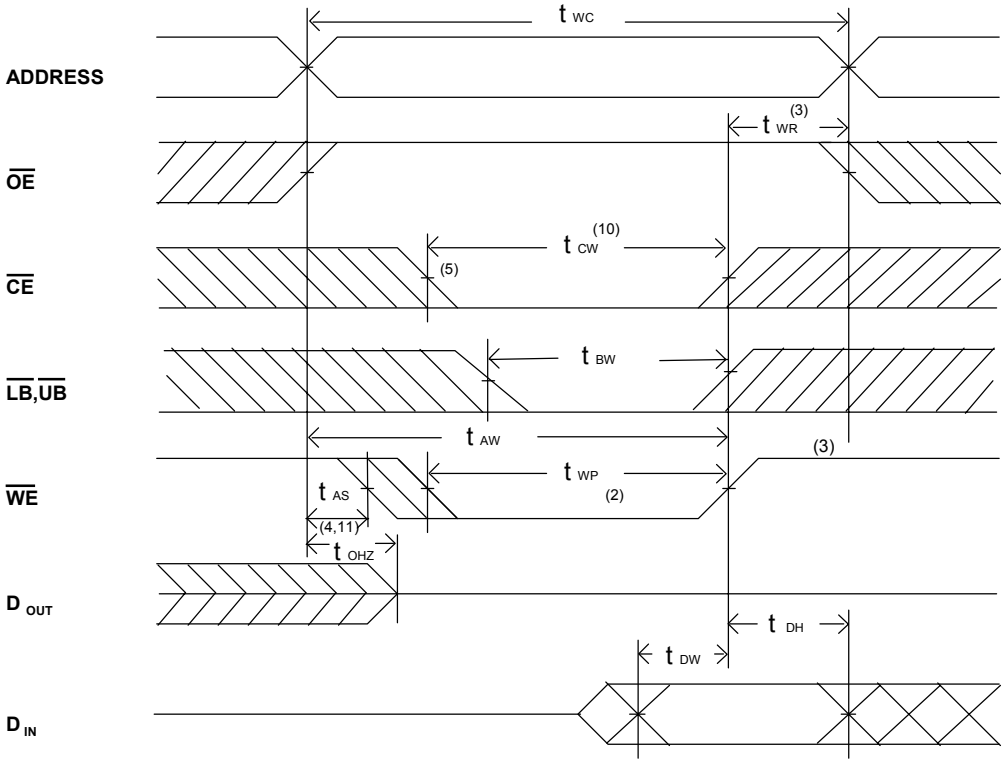
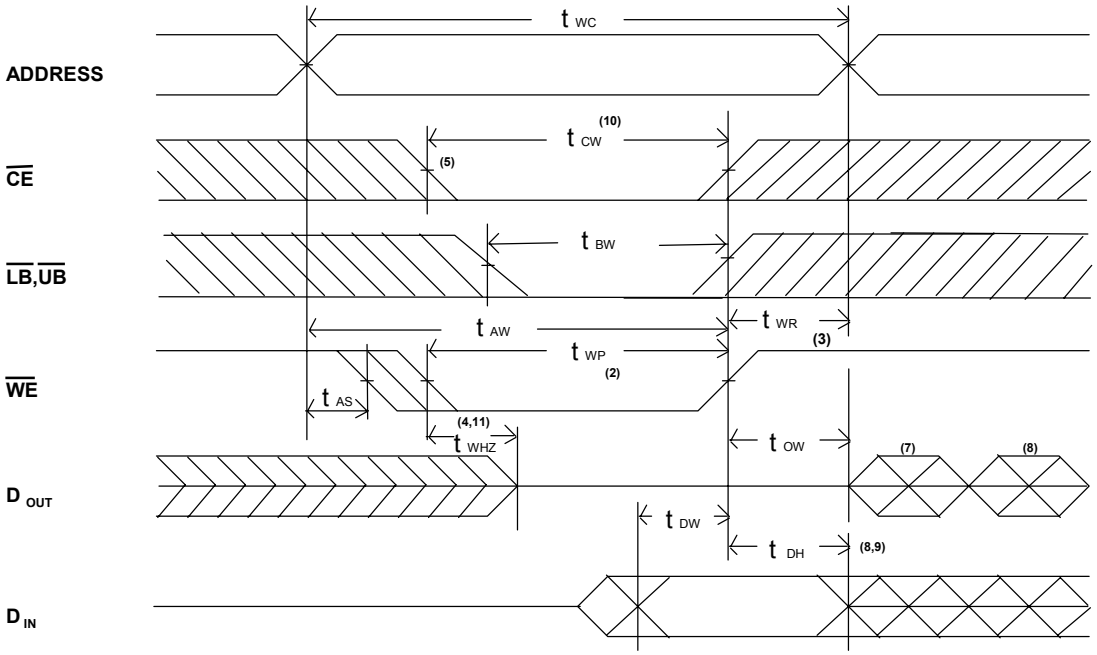
■ SWITCHING WAVEFORMS (WRITE CYCLE)

WRITE CYCLE1 (1)



WRITE CYCLE2 (1,6)



NOTES:

1. $\overline{WE}$ must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of $\overline{CE}$ and $\overline{WE}$ low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. T_{WR} is measured from the earlier of $\overline{CE}$ or $\overline{WE}$ going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\overline{CE}$ low transition occurs simultaneously with the $\overline{WE}$ low transitions or after the $\overline{WE}$ transition, output remain in a high impedance state.
6. $\overline{OE}$ is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If $\overline{CE}$ is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. T_{CW} is measured from the later of $\overline{CE}$ going low to the end of write.
11. The parameter is guaranteed but not 100% tested.
