

Very Low Power/Voltage CMOS SRAM 256K x 16 or 512K x 8 bit switchable

BS616LV4023

■ FEATURES

- Very low operation voltage : 2.4 ~ 3.6V
- Very low power consumption :
 - V_{cc} = 3.0V C-grade: 20mA (Max.) operating current
 - I-grade : 25mA (Max.) operating current
 - 0.25uA (Typ.) CMOS standby current
- High speed access time :
 - 70 70ns (Max.) at V_{cc}=3.0V
 - 10 100ns (Max.) at V_{cc}=3.0V
- Automatic power down when chip is deselected
- Three state outputs and TTL compatible
- Fully static operation
- Data retention supply voltage as low as 1.5V
- Easy expansion with CE1, CE2 and OE options
- I/O Configuration x8/x16 selectable by CIO, LB and UB pin

■ DESCRIPTION

The BS616LV4023 is a high performance, very low power CMOS Static Random Access Memory organized as 262,144 words by 16 bits or 524,288 bytes by 8 bits selectable by CIO pin and operates from a wide range of 2.4V to 3.6V supply voltage.

Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.25uA and maximum access time of 70/100ns in 3V operation.

Easy memory expansion is provided by active HIGH chip enable2(CE2), active LOW chip enable1(CE1), active LOW output enable(OE) and three-state output drivers.

The BS616LV4023 has an automatic power down feature, reducing the power consumption significantly when chip is deselected.

The BS616LV4023 is available in DICE form and 48-ball BGA type.

■ PIN DESCRIPTIONS

Name	Function
A0-A17 Address Input	These 18 address inputs select one of the 262,144 x 16-bit words in the RAM.
SAE Address Input	This address input incorporates with the above 17 address input select one of the 262,144 x 8-bit bytes in the RAM if the CIO is LOW. Don't use when CIO is HIGH.
CIO x8/x16 select input	This input selects the organization of the SRAM. 262,144 x 16-bit words configuration is selected if CIO is HIGH. 524,288 x 8-bit bytes configuration is selected if CIO is LOW.
$\overline{\text{CE1}}$ Chip Enable 1 Input $\overline{\text{CE2}}$ Chip Enable 2 Input	$\overline{\text{CE1}}$ is active LOW and $\overline{\text{CE2}}$ is active HIGH. Both chip enables must be active to read from or write to the device. If either chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high impedance state when the device is deselected.
$\overline{\text{WE}}$ Write Enable Input	The write enable input is active LOW and controls read and write operations. With the chip selected, when $\overline{\text{WE}}$ is HIGH and $\overline{\text{OE}}$ is LOW, output data will be present on the DQ pins; when $\overline{\text{WE}}$ is LOW, the data present on the DQ pins will be written into the selected memory location.
$\overline{\text{OE}}$ Output Enable Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when $\overline{\text{OE}}$ is inactive.
$\overline{\text{LB}}$ and $\overline{\text{UB}}$ Data Byte Control Input	Lower byte and upper byte data input/output control pins. The chip is deselected when both $\overline{\text{LB}}$ and $\overline{\text{UB}}$ pins are HIGH.
D0 - D15 Data Input/Output Ports	These 16 bi-directional ports are used to read data from or write data into the RAM.

■ SWITCHING WAVEFORMS (WRITE CYCLE)
WRITE CYCLE1⁽¹⁾

WRITE CYCLE2 (1,6)

NOTES:

1. $\overline{WE}$ must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of CE2, $\overline{CE1}$ and $\overline{WE}$ low.
All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. t_{wr} is measured from the earlier of CE2 going low, or $\overline{CE1}$ or $\overline{WE}$ going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the CE2 high transition or $\overline{CE1}$ low transition or $\overline{LB}, \overline{UB}$ low transition occurs simultaneously with the $\overline{WE}$ low transitions or after the $\overline{WE}$ transition, output remain in a high impedance state.
6. $\overline{OE}$ is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If CE2 is high or $\overline{CE1}$ is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. t_{cw} is measured from the later of CE2 going high or $\overline{CE1}$ going low to the end of write.
