

T-75-07-07

**UM91210/30**

**Tone/Pulse Dialer**

**Features**

- 32-digit Redial Memory
- Tone/Pulse Switchable via slide switch
- Wide operating voltage: 2.0V to 5.5V
- Uses inexpensive 3.58 MHz TV crystal
- Pin selectable Make/Break ratio (1/2 or 2/3)
- Key-in tone output for valid key entry in Pulse mode

- (91230 C/D only)
- 630 millisecond flash time
- "T" key controlled switching from Pulse to Tone mode (91230 C/D only)
- 18-pin or 22-pin DIP
- With minimum tone duration 110 ms

**General Description**

The products in this series are Tone/Pulse switchable dialers with 32-digit redial memory. Switching from Pulse to DTMF mode can be accomplished either by using a slide switch or by depressing the key.

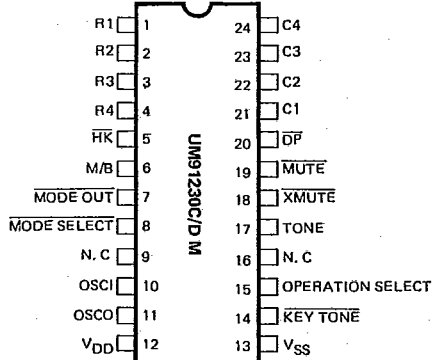

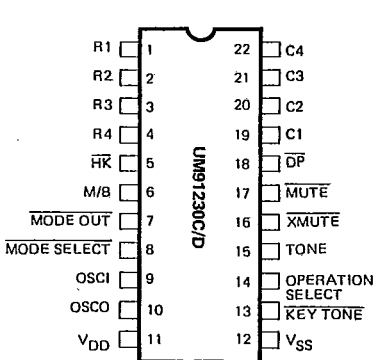

CMOS technology is used in the production of these devices, resulting in low power requirements and high noise immunity. These devices can be easily interfaced with a variety of telephones, requiring only a minimum number of external components.

The necessary dual-tone frequencies are all derived from a 3.58 MHz TV crystal, thus providing high accuracy and stability. The sinusoidal waveform for each individual tone is digitally synthesized on the chip. Waveforms thus generated have low total harmonic distortion (5% max.). A reference voltage is generated on the chip which is stable over the operating voltage and temperature range. It regulates the signal levels of the dual tones to meet telephone industry specifications.

**Absolute Maximum Ratings\***

Power Supply Voltage.....-0.3V to +0.6V  
 Input Voltage.....-0.3V to V<sub>DD</sub>+0.3V  
 Maximum Power Dissipation (at 25°C).....500mW  
 Operating Temperature (T<sub>OP</sub>).....-20°C to 70°C  
 Storage Temperature (T<sub>STG</sub>).....-55°C to +150°C

**\*Comments**

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied and exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Description

Pin		Designation	Description
91210	91230		
1	1	R1	Input Keys. These pins serve as an interface to an XY matrix keyboard. C1 through C4 and R1 through R4 are set to low at On Hook ( $\overline{HK}$ =high). C1 through C4 are set to low and R1 through R4 are set to high at Off Hook ( $\overline{HK}$ =low), which enables the key-in operation. The Oscillator starts running when a keypress is detected. Scanning signals are presented at both column and row input signals (Typ: 445 Hz) until the input key is released. Key-in is compatible with standard 2-of-8 form or single-contact keyboards. Debouncing is provided to avoid false entry (Typ.: 23 ms).
2	2	R2

Operation Procedures

Symbol definitions

- Dp: Pulse digit, 1,2,3,4,5,6,7,8,9,0.
- Dt: Tone digit, 1,2,3,4,5,6,7,8,9,0,\*,#.
- ZiZiZi: Conversation.
- 0-01: Off-hook.
- 0-01: On-hook.
- : Input level from low to high
- : Input level from high to low.

used as a pause key in pulse mode. A pause can be cancelled with the **[P]**, **[T]** or **[R]** keys during pause time when redialing.

4. Redialing
  - a. 0-01, Dp.....Dp, 0-01, 0-01, **[R]**
  - b. 0-01, Dt.....Dt, 0-01, 0-01, **[R]**

Note: The **[R]** key is disabled while Pulse or DTMF signals are being transmitted. When more than 32 digits have been dialed as a single number, redialing will be inhibited. The **[#]** key can be used as an **[R]** key in Pulse mode.

Recommended Dialing, Redialing, Mixed Dialing operations

1. Normal Dialing in Pulse Mode  
0-01, Dp.....Dp, ZiZiZi, 0-01.
2. Normal Dialing in Tone Mode
  - a. 0-01, Dt.....Dt, ZiZiZi, 0-01.
  - b. 0-01, T, Dt.....Dt, ZiZiZi, 0-01. (UM91230C/D only)
3. Manual Dialing with Automatic Access Pause
  - a. 0-01, Dp, P, Dp.....Dp, ZiZiZi, 0-01 or
  - b. 0-01, Dt, P, Dt.....Dt, ZiZiZi, 0-01.

5. Inhibiting Redial
  - a. 0-01, Dp.....Dp, **[R]**, **[R]**
  - b. 0-01, Dt.....Dt, **[R]**, **[R]**

Note: Lift the receiver. Dial a number in Pulse mode. Press the **[R]** key twice.

Note: Each **[P]** key-in provides 3.6 seconds of pause time. **[P]** key entry is ignored if it is the first digit after going Off Hook. The **[\*]** key can also be

6. Pulse/Tone Switchable Operations
  - a. Mode switching by **MODE SELECT** input: (For UM91230C/D, **OPERATION SELECT** = V<sub>SS</sub>.)  
 0-01, Dp.....Dp, P, **MODE SELECT**, **[L]**, Dt..... Dt  
 |-----Pulse mode-----|Tone Mode|

UM91210/30

T-75-07-07

Note: If the **[P]** key is not pressed as one of the series of digits before or after the mode is switched, the following condition will result:

(1) If a Tone digit is pressed after the Pulse digits have finished going out, the DTMF mode will be implemented after the last Pulse signal has been transmitted in this mode. Tone digits will be transmitted from the Tone Out pin as a DTMF signal when the corresponding keys are depressed.

(2) If Tone digits are keyed in while the Pulse signal is still being sent out, the DTMF mode will take over but will be put on hold until the last Pulse signal has gone out. MODE OUT will flash to indicate that you are now in the hold state (for UM91230C/D only). Tone digits will be stored in Redial memory as DTMF data, but will not be transmitted from TONE OUT. When the data is ready for transmission from Redial Memory, the **[T]** (for UM91230C/D only), **[R]** or **[P]** keys can be pressed to reset the Hold state and the DTMF data will be serially transmitted.

b. Mode Switching by **[T]** key: (OPERATION SELECT =  $V_{DD}$  for UM91230C/D only)  
 0-01, Dp,.....Dp, P, T, Dt.....Dt  
 |—Pulse mode —|Tone mode|

Note: If the **[P]** key is not pressed serially before or after the **[T]** key, the following conditions will result:  
 (1) If a Tone digit is pressed after the digits in

the Pulse mode have finished going out, the DTMF mode will become operational after transmission of the last Pulse signal. In this mode, the Tone digits are transmitted from TONE OUT as DTMF signals when the corresponding keys are depressed.

(2) If a Tone digit is pressed while the Pulse signals are still going out, the DTMF mode will become operational but will remain in the Pause state after the last Pulse signal has been transmitted. MODE OUT will flash to indicate that you are in the Pause state and the remaining Tone digits will be stored in redial memory as DTMF data but will not be transmitted from Tone Out. When the chip is ready to transmit the DTMF data in Redial Memory, the **[T]**, **[R]**, or **[P]** keys can be depressed to reset the Pause state and the DTMF data will be serially transmitted.

7. Redial with the Pause State Cancelled  
 0-01, **[R]**, **[P]**, or **[T]**.

Note: (1) Pause time can be cancelled by pressing the **[P]**, **[R]** or **[T]** keys during pause time when redialing. Any other pause in the series is also cancelled.

(2) If a pause was not stored before or after the mode was switched, the chip will go into the Pause state when the DTMF mode is activated. MODE OUT will flash to indicate that you are in the Pause state. DTMF data will be stored in the Redial Memory and not transmitted from Tone Out. After **[R]**, **[P]** or **[T]** are depressed to reset the Pause state, DTMF data will be serially transmitted.

2. DTMF Generation

The DTMF signal is produced from the Tone Frequency Generator circuit with an NPN transistor-emitter-follower output buffer (Figure 1, below). The digitally synthesized sine wave is well designed, with an eight-level, 16-segment, fixed amplitude. It provides ( $V_{DD}-1.8V$ ) a

reference voltage structure (Figure 2). The Total Harmonic Distortion (THD) of the DTMF output is 5% maximum. THD versus Operating Voltage and DTMF output amplitude versus Operating Voltage is shown in Figure 3 and Figure 4.
