## MC14569B

## Programmable Divide-By-N Dual 4-Bit Binary/BCD Down Counter

The MC14569B is a programmable divide-by-N dual 4-bit binary or BCD down counter constructed with MOS P-channel and N -channel enhancement mode devices (complementary MOS) in a monolithic structure.

This device has been designed for use with the MC14568B phase comparator/counter in frequency synthesizers, phase-locked loops, and other frequency division applications requiring low power dissipation and/or high noise immunity.

- Speed-up Circuitry for Zero Detection
- Each 4-Bit Counter Can Divide Independently in BCD or Binary Mode
- Can be Cascaded With MC14526B for

Frequency Synthesizer Applications

- All Outputs are Buffered
- Schmitt Triggered Clock Conditioning

MAXIMUM RATINGS (Voltages Referenced to $\mathrm{V}_{\mathrm{SS}}$ ) (Note 1.)

| Symbol | Parameter | Value | Unit |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}$ | DC Supply Voltage Range | -0.5 to +18.0 | V |
| $\mathrm{~V}_{\text {in }}, \mathrm{V}_{\text {out }}$ | Input or Output Voltage Range <br> (DC or Transient) | -0.5 to $\mathrm{V}_{\mathrm{DD}}+0.5$ | V |
| $\mathrm{I}_{\text {in }}, \mathrm{I}_{\text {out }}$ | Input or Output Current <br> (DC or Transient) per Pin | $\pm 10$ | mA |
| $\mathrm{P}_{\mathrm{D}}$ | Power Dissipation, <br> per Package (Note 2.) | 500 | mW |
| $\mathrm{~T}_{\mathrm{A}}$ | Ambient Temperature Range | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage Temperature Range | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{L}}$ | Lead Temperature <br> (8-Second Soldering) | 260 | ${ }^{\circ} \mathrm{C}$ |

1. Maximum Ratings are those values beyond which damage to the device may occur.
2. Temperature Derating:

Plastic "P and D/DW" Packages: $-7.0 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ From $65^{\circ} \mathrm{C}$ To $125^{\circ} \mathrm{C}$
This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, $\mathrm{V}_{\text {in }}$ and $\mathrm{V}_{\text {out }}$ should be constrained to the range $\mathrm{V}_{\mathrm{SS}} \leq\left(\mathrm{V}_{\text {in }}\right.$ or $\left.\mathrm{V}_{\text {out }}\right) \leq \mathrm{V}_{\mathrm{DD}}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ ). Unused outputs must be left open.

## SWITCHING WAVEFORMS

Figure 1.

Figure 2.

## INPUTS

P0, P1, P2, P3 (Pins 3, 4, 5, 6) - Preset Inputs. Programmable inputs for the least significant counter. May be binary or BCD depending on the control input.

P4, P5, P6, P7 (Pins 11, 12, 13, 14) - Preset Inputs. Programmable inputs for the most significant counter. May be binary or BCD depending on the control input.

Clock (Pin 9) - Preset data is decremented by one on each positive transition of this signal.

## OUTPUTS

Zero Detect (Pin 1) - This output is normally low and goes high for one clock cycle when the counter has decremented to zero.

Q (Pin 15) - Output of the last stage of the most significant counter. This output will be inactive unless the preset input P7 has been set high.

## CONTROLS

Cascade Feedback (Pin 7) - This pin is normally set high. When low, loading of the preset inputs (P0 through P7) is inhibited, i.e., P0 through P7 are "don't cares." Refer to Table 1 for output characteristics.
$\mathbf{C T L}_{1}($ Pin 2) - This pin controls the counting mode of the least significant counter. When set high, counting mode is BCD. When set low, counting mode is binary.
$\mathbf{C T L}_{2}(\operatorname{Pin} 10)$ - This pin controls the counting mode of the most significant counter. When set high, counting mode is BCD. When set low, counting mode is binary.

## SUPPLY PINS

$\mathbf{V}_{\text {SS }}$ (Pin 18) - Negative Supply Voltage. This pin is usually connected to ground.
$\mathbf{V}_{\text {DD }}$ (Pin 16) - Positive Supply Voltage. This pin is connected to a positive supply voltage ranging from 3.0 volts to 18.0 volts.

## OPERATING CHARACTERISTICS

The MC14569B is a programmable divide-by-N dual 4-bit down counter. This counter may be programmed (i.e., preset) in BCD or binary code through inputs P0 to P7. For each counter, the counting sequence may be chosen independently by applying a high (for BCD count) or a low (for binary count) to the control inputs $\mathrm{CTL}_{1}$ and $\mathrm{CTL}_{2}$.

The divide ratio N ( N being the value programmed on the preset inputs P0 to P7) is automatically loaded into the counter as soon as the count 1 is detected. Therefore, a division ratio of one is not possible. After N clock cycles,
one pulse appears on the Zero Detect output. (See Timing Diagram.) The Q output is the output of the last stage of the most significant counter (See Tables 1 through 5, Mode Controls.)
When cascading the MC14569B to the MC14526B, the Cascade Feedback input, Q, and Zero Detect outputs must be respectively connected to " 0 ", Clock, and Load of the following counter. If the MC14569B is used alone, Cascade Feedback must be connected to $V_{D D}$.

## MC14569B

Table 1. Mode Controls (Cascade Feedback = Low)

| Counter Control Values |  | Divide Ratio |  |
| :---: | :---: | :---: | :---: |
| CTL $_{\mathbf{1}}$ | CTL $_{\mathbf{2}}$ | Zero Detect | $\mathbf{Q}$ |
| 0 | 0 | 256 | 256 |
| 0 | 1 | 160 | 160 |
| 1 | 0 | 160 | 160 |
| 1 | 1 | 100 | 100 |

NOTE: Data Preset Inputs (P0-P7) are "Don't Cares" while Cascade Feedback is Low.
