

NCP1232

Microprocessor Monitor

The NCP1232 is a fully-integrated processor supervisor. It provides three important functions to safeguard processor functionality: precision power on/off reset control, watchdog timer and external reset override.

On power-up, the NCP1232 holds the processor in the reset state for a minimum of 250 msec after V_{CC} is within tolerance to ensure a stable system start-up.

Microprocessor functionality is monitored by the on-board watchdog circuit. The microprocessor must provide a periodic low-going signal on the $\overline{ST}$ input. Should the processor fail to supply this signal within the selected time-out period (150 msec, 600 msec or 1200 msec), an out-of-control processor is indicated and the NCP1232 issues a processor reset as a result.

The outputs of the NCP1232 are immediately driven active when the PB input is brought low by an external push-button switch or other electronic signal. When connected to a push-button switch, the NCP1232 provides contact debounce.

The NCP1232 is packaged in a space-saving 8-pin plastic SOIC package and requires no external components.

Features

- Precision Voltage Monitor
(Adjustable +4.5 V or +4.75 V)
- Reset Pulse Width (250 msec Min)
- No External Components
- Adjustable Watchdog Timer
(150 msec, 600 msec or 1.2 sec)
- Debounced Manual Reset Input for External Override

Applications

- Computers
- Controllers
- Intelligent Instruments
- Automotive Systems
- Critical μP Power Monitoring

FUNCTIONAL BLOCK DIAGRAM

PIN DESCRIPTION

Pin No. (8-Pin SOIC)	Symbol	Description
1	$\overline{\text{PB RST}}$	Push-button Reset Input. A debounced active-low input that ignores pulses less than 1 msec in duration and is guaranteed to recognize inputs of 20 msec or greater.
2	TD	Time Delay Set. The watchdog time-out select input ($t_{\text{TD}} = 150$ msec for TD = 0 V, $t_{\text{TD}} = 600$ msec for TD = open, $t_{\text{TD}} = 1.2$ sec for TD = V_{CC} .)
3	TOL	Tolerance Input. Connect to GND for 5% tolerance or to V_{CC} for 10% tolerance.
4	GND	Ground.
5	RST	Reset Output (Active High) – goes active: 1. If V_{CC} falls below the selected reset voltage threshold 2. If $\overline{\text{PB RST}}$ is forced low 3. If $\overline{\text{ST}}$ is not strobed within the minimum time-out period 4. During power-up
6	$\overline{\text{RST}}$	Reset Output (Active Low, Open Drain) – see RST.
7	$\overline{\text{ST}}$	Strobe Input. Input for watchdog timer.
8	V_{CC}	The +5 V Power Supply Input.

ABSOLUTE MAXIMUM RATINGS* Voltage on any pin (with respect to GND) –0.3 V to +5.8 V

Rating	Value	Unit
Operating Temperature Range	–40 to +85	°C
Storage Temperature Range, T _{stg}	–65 to +150	°C
Lead Temperature (Soldering, 10 sec)	+300	°C

*Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS (T_A = T_{MIN} to T_{MAX}; V_{CC} = +4.5 V to 5.5 V, unless otherwise specified.)

Characteristic	Symbol	Test Conditions	Min	Typ	Max	Unit
Supply Voltage	V _{CC}	–	4.5	5.0	5.5	V
$\overline{ST}$ and PB RST Input High Level	V _{IH}	Note 1.	2.0	–	V _{CC} + 0.3	V
$\overline{ST}$ and PB RST Input Low Level	V _{IL}	–	–0.3	–	+0.8	V

V _{CC} Detect to RST High and $\overline{RST}$ Low	t _{RPD}	Figure 7, V _{CC} Falling	–	–	100	nsec
V _{CC} Detect to RST High and $\overline{RST}$ Open (Note 6.)	t _{RPU}	Figure 8, V _{CC} Rising	250	610	1000	msec

1. PB RST is internally pulled up to V_{CC} with an internal impedance of typically 40 kΩ.
2. Measured with outputs open.
3. All voltages references to GND.
4. Guaranteed by design.
5. PB RST must be held low for a minimum of 20 msec to guarantee a reset.
6. t_R = 5 μsec.

Power Monitor

The NCP1232 detects out-of-tolerance power supply conditions and warns a processor-based system of an impending power failure. When V_{CC} is detected as below the preset level defined by TOL , the V_{CC} comparator outputs the signals $\overline{RST}$ and $\overline{RST}$. If TOL is connected to ground, the $\overline{RST}$ and $\overline{RST}$ signals become active as V_{CC} falls below 4.75 volts. If TOL is connected to V_{CC} , the $\overline{RST}$ and $\overline{RST}$ become active as V_{CC} falls below 4.5 volts. Because the processing is stopped at the last possible moment of valid V_{CC} , the $\overline{RST}$ and $\overline{RST}$ are excellent control signals for a μP . The reset outputs will remain in their active states until V_{CC} has been continuously in-tolerance for a minimum of 250 msec allowing the power supply and μP to stabilize before $\overline{RST}$ is released.

Push-button Reset Input

The debounced manual reset input ($\overline{PB RST}$) manually forces the reset outputs into their active states. Once $\overline{PB RST}$ has been low for a time, $t_{PB D}$, the push-button delay time, the reset outputs go active. The reset outputs remain in their active states for a minimum of 250 msec after $\overline{PB RST}$ rises above V_{IH} (Figure 3).

A mechanical push-button or active logic signal can drive the $\overline{PB RST}$ input. The debounced input ignores input pulses less than 1 msec and is guaranteed to recognize pulses of 20 msec or greater. No external pull-up resistor is required because the $\overline{PB RST}$ input has an internal pull-up to V_{CC} of approximately 100 μA .

Watchdog Timer

When the $\overline{ST}$ input is not stimulated for a preset time period, the watchdog timer function forces $\overline{RST}$ and $\overline{RST}$ signals to the active state. The preset time period is determined by the $\overline{TD}$ inputs to be 150 msec with $\overline{TD}$ connected to ground, 600 msec with $\overline{TD}$ open, or 1200 msec with $\overline{TD}$ connected to V_{CC} , typical. The watchdog timer starts timing out from the set time period as soon as $\overline{RST}$ and $\overline{RST}$ are inactive. If a high-to-low transition occurs on the $\overline{ST}$ input pin prior to time-out, the watchdog timer is reset and begins to time-out again. If the watchdog timer is allowed to time-out, then the $\overline{RST}$ and $\overline{RST}$ signals are driven to the active state for 250 msec minimum (Figure 2).

The software routine that strobes $\overline{ST}$ is critical. The code must be in a section of software that is executed regularly so the time between toggles is less than the watchdog time-out period. One common technique controls the μP I/O line from two sections of the program. The software might set the

I/O line high while operating in the foreground mode and set it low while in the background or interrupt mode. If both modes do not execute correctly, the watchdog timer issues reset pulses.

Supply Monitor Noise Sensitivity

The NCP1232 is optimized for fast response to negative-going changes in V_{DD} . Systems with an inordinate amount of electrical noise on V_{DD} (such as systems using relays), may require a 0.01 μF or 0.1 μF bypass capacitor to reduce detection sensitivity. This capacitor should be installed as close to the NCP1232 as possible to keep the capacitor lead length short.

Figure 3. Push-button Reset. The debounced $\overline{\text{PB RST}}$ input ignores input pulses less than 1 msec and is guaranteed to recognized pulses of 20 msec or greater

PUSH-BUTTON RESET

Figure 4. Strobe Input

NOTE: t_{TD} is the maximum elapsed time between $\overline{\text{ST}}$ high-to-low transistions ($\overline{\text{ST}}$ is activated by falling edges only) which will keep the watchdog timer from forcing the reset outputs active for a time of t_{RST} . t_{TD} is a function of the voltage at the TD pin, as tabulated below.

CONDITION	MIN	t_{TD} TYP	MAX
TD PIN = 0 V	62.5 msec	150 msec	250 msec
TD PIN = OPEN	250 msec	600 msec	1000 msec
TD PIN = V_{CC}	500 msec	1200 msec	2000 msec
