## NCS2001

### 0.9 V, Rail-to-Rail, Single Operational Amplifier

The NCS2001 is an industry first sub-one volt operational amplifier that features a rail-to-rail common mode input voltage range, along with rail-to-rail output drive capability. This amplifier is guaranteed to be fully operational down to 0.9 V , providing an ideal solution for powering applications from a single cell Nickel Cadmium (NiCd) or Nickel Metal Hydride (NiMH) battery. Additional features include no output phase reversal with overdriven inputs, trimmed input offset voltage of 0.5 mV , extremely low input bias current of 40 pA , and a unity gain bandwidth of 1.4 MHz at 5.0 V . The tiny NCS2001 is the ideal solution for small portable electronic applications and is available in the space saving SOT23-5 and SC70-5 packages with two industry standard pinouts.

## Features

- 0.9 V Guaranteed Operation
- Rail-to-Rail Common Mode Input Voltage Range
- Rail-to-Rail Output Drive Capability
- No Output Phase Reversal for Over-Driven Input Signals
- 0.5 mV Trimmed Input Offset
- 10 pA Input Bias Current
- 1.4 MHz Unity Gain Bandwidth at $\pm 2.5 \mathrm{~V}, 1.1 \mathrm{MHz}$ at $\pm 0.5 \mathrm{~V}$
- Tiny SC70-5 and SOT23-5 Packages

## Typical Applications

- Single Cell NiCd/NiMH Battery Powered Applications
- Cellular Telephones
- Pagers
- Personal Digital Assistants
- Electronic Games
- Digital Cameras
- Camcorders
- Hand Held Instruments

This device contains 63 active transistors.

## APPLICATION INFORMATION AND OPERATING DESCRIPTION

## GENERAL INFORMATION

The NCS2001 is an industry first rail-to-rail input, rail-to-rail output amplifier that features guaranteed sub one volt operation. This unique feature set is achieved with the use of a modified analog CMOS process that allows the implementation of depletion MOSFET devices. The amplifier has a 1.0 MHz gain bandwidth product, $2.2 \mathrm{~V} / \mu \mathrm{s}$ slew rate and is operational over a power supply range less than 0.9 V to as high as 7.0 V .

## Inputs

The input topology chosen for this device series is unconventional when compared to most low voltage operational amplifiers. It consists of an N -channel depletion mode differential transistor pair that drives a folded cascade stage and current mirror. This configuration extends the input common mode voltage range to encompass the $\mathrm{V}_{\mathrm{EE}}$ and $\mathrm{V}_{\mathrm{CC}}$ power supply rails, even when powered from a combined total of less than 0.9 volts. Figure 27 and 28 show the input common mode voltage range versus power supply voltage.

The differential input stage is laser trimmed in order to minimize offset voltage. The N -channel depletion mode MOSFET input stage exhibits an extremely low input bias current of less than 10 pA . The input bias current versus temperature is shown in Figure 4. Either one or both inputs can be biased as low as $\mathrm{V}_{\mathrm{EE}}$ minus 300 mV to as high as 7.0 V without causing damage to the device. If the input common mode voltage range is exceeded, the output will not display a phase reversal. If the maximum input positive or negative voltage ratings are to be exceeded, a series resistor must be used to limit the input current to less than 2.0 mA .

The ultra low input bias current of the NCS2001 allows the use of extremely high value source and feedback resistor without reducing the amplifier's gain accuracy. These high value resistors, in conjunction with the device input and printed circuit board parasitic capacitances $\mathrm{C}_{\mathrm{in}}$, will add an additional pole to the single pole amplifier in Figure 30. If low enough in frequency, this additional pole can reduce the phase margin and significantly increase the output settling time. The effects of $\mathrm{C}_{\mathrm{in}}$, can be canceled by placing a zero into the feedback loop. This is accomplished with the addition of capacitor $\mathrm{C}_{\mathrm{fb}}$. An approximate value for $\mathrm{C}_{\mathrm{fb}}$ can be calculated by:

$$
\mathrm{C}_{\mathrm{fb}}=\frac{\mathrm{R}_{\mathrm{in}} \times \mathrm{C}_{\mathrm{in}}}{\mathrm{R}_{\mathrm{fb}}}
$$

$$
\mathrm{C}_{\text {in }}=\text { Input and printed circuit board capacitance }
$$

Figure 30. Input Capacitance Pole Cancellation

## Output

The output stage consists of complimentary P and N channel devices connected to provide rail-to-rail output drive. With a 2.0 k load, the output can swing within 50 mV of either rail. It is also capable of supplying over 75 mA when powered from 5.0 V and 1.0 mA when powered from 0.9 V .

When connected as a unity gain follower, the NCS2001 can directly drive capacitive loads in excess of 820 pF at room temperature without oscillating but with significantly reduced phase margin. The unity gain follower configuration exhibits the highest bandwidth and is most prone to oscillations when driving a high value capacitive load. The capacitive load in combination with the amplifier's output impedance, creates a phase lag that can result in an under-damped pulse response or a continuous oscillation. Figure 32 shows the effect of driving a large capacitive load in a voltage follower type of setup. When driving capacitive loads exceeding 820 pF , it is recommended to place a low value isolation resistor between the output of the op amp and the load, as shown in figure 31. The series resistor isolates the capacitive load from the output and enhances the phase margin. Refer to figure 33. Larger values of R will result in a cleaner output waveform but excessively large values will degrade the large signal rise and fall time and reduce the output amplitude. Depending upon the capacitor characteristics, the isolation resistor value will typically be between 50 to 500 ohms. The output drive capability for resistive and capacitive loads is shown in Figures 2, 3, and 23.

Isolation resistor $\mathrm{R}=50$ to 500
Figure 31. Capacitance Load Isolation

Note that the lowest phase margin is observed at cold temperature and low supply voltage.

Figure 32. Small Signal Transient Response with Large Capacitive Load

Figure 33. Small Signal Transient Response with Large Capacitive Load and Isolation Resistor.

The non-inverting input threshold levels are set so that the capacitor voltage oscillates between $1 / 3$ and $2 / 3$ of $V_{C C}$. This requires the resistors $R_{1 a}, R_{1 b}$ and $R_{2}$ to be of equal value. The following formula can be used to approximate the output frequency.

$$
\mathrm{f}_{\mathrm{O}}=\frac{1}{1.39 \mathrm{R}_{\mathrm{T}} \mathrm{C}_{\mathrm{T}}}
$$

Figure 34. 0.9 V Square Wave Oscillator

The timing capacitor $C_{T}$ will charge through diode $D_{2}$ and discharge through diode $D_{1}$, allowing a variable duty cycle. The pulse width of the signal can be programmed by adjusting the value of the trimpot. The capacitor voltage will oscillate between $1 / 3$ and $2 / 3$ of $\mathrm{V}_{\mathrm{CC}}$, since all the resistors at the non-inverting input are of equal value.

## MINIMUM RECOMMENDED FOOTPRINT FOR SURFACE MOUNTED APPLICATIONS

Surface mount board layout is a critical portion of the total design. The footprint for the semiconductor packages must be the correct size to insure proper solder connection
interface between the board and the package. With the correct pad geometry, the packages will self align when subjected to a solder reflow process.

#### Abstract

ON Semiconductor and are trademarks of Semiconductor Components Industries, LLC (SCILLC). SCILLC reserves the right to make changes without further notice to any products herein. SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer.
