

MC14034B

8-Bit Universal Bus Register

The MC14034B is a bidirectional 8-bit static parallel/serial, input/output bus register. The device contains two sets of input/output lines which allows the bidirectional transfer of data between two buses; the conversion of serial data to parallel form, or the conversion of parallel data to serial form. Additionally the serial data input allows data to be entered shift/right, while shift/left can be accomplished by hard-wiring each parallel output to the previous parallel bit input.

Other useful applications for this device include pseudo-random code generation, sample and hold register, frequency and phase-comparator, address or buffer register, and serial/parallel input/output conversions.

- Bidirectional Parallel Data Input
- Diode Protection on All Inputs
- Supply Voltage Range = 3.0 Vdc to 18 Vdc
- Capable of Driving Two Low-power TTL Loads or One Low-power Schottky TTL Load Over the Rated Temperature Range.
- Pin-for-Pin Replacement for CD4034B.

MAXIMUM RATINGS* (Voltages Referenced to V_{SS})

Symbol	Parameter	Value	Unit
V_{DD}	DC Supply Voltage	- 0.5 to + 18.0	V
V_{in}, V_{out}	Input or Output Voltage (DC or Transient)	- 0.5 to $V_{DD} + 0.5$	V
I_{in}, I_{out}	Input or Output Current (DC or Transient), per Pin	± 10	mA
P_D	Power Dissipation, per Package†	500	mW
T_{stg}	Storage Temperature	- 65 to + 150	°C
T_L	Lead Temperature (8-Second Soldering)	260	°C

* Maximum Ratings are those values beyond which damage to the device may occur.

† Temperature Derating:

Plastic "P and D/DW" Packages: - 7.0 mW/°C From 65°C To 125°C

Ceramic "L" Packages: - 12 mW/°C From 100°C To 125°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range $V_{SS} \leq (V_{in} \text{ or } V_{out}) \leq V_{DD}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}). Unused outputs must be left open.

X = Don't Care

†Outputs change at positive transition of clock in the serial mode and when the A/S input is low in the parallel mode. During transfer from parallel to serial operation, A/S should remain low in order to prevent D_S transfer into flip-flops.

EXPANDED BLOCK DIAGRAM

OPERATING CHARACTERISTICS

The MC14034B is composed of eight register cells connected in cascade with additional control logic. Each register cell is composed of one "D" master-slave flip-flop with separate internal clocks, and two data transfer gates allowing the data to be transferred bi-directionally from bus A to bus B and from bus B to bus A, and to be memorized. Besides the single phase clock and the serial data inputs, the control logic provides four other features:

A Enable Input — When high, this input enables the bus A data lines.

A/B Input (Data A or B) — This input controls the direction of data flow: when high, the data flows from bus A to bus

B; when low, the data flows from bus B to bus A.

P/S Input (Parallel/Serial) — This input controls the data input mode (parallel or serial). When high, the data is transferred to the register in a parallel asynchronous mode or a parallel synchronous mode (positive clock transition). When low, the data is entered into the register in a serial synchronous mode (positive clock transition).

A/S Input (Asynchronous/Synchronous to the Clock) — When this input is high, the data is transferred independently from the clock rate; when low, the clock is enabled and the data is transferred synchronously.

LOGIC DIAGRAM

Figure 4. Power Dissipation Test Circuit and Waveforms

Figure 5. 16-Bit Parallel In/Parallel Out, Parallel In/Serial Out, Serial In/Parallel Out, Serial In/Serial Out Register

A "High" ("Low") on the Shift Left/Shift Right input allows serial data on the Shift Left Input (Shift Right Input) to enter the register on the positive transition of the clock signal. A "high" on the "A" Enable Input disables the "A" parallel data lines on Reg. 1 and 2 and enables the "A" data lines on registers 3 and 4 and allows parallel data into registers 1 and 2. Other logic schemes may be used in place of registers 3 and 4 for parallel loading.

When parallel inputs are not used, Reg. 3 and 4 and associated logic are not required.

*Shift left input must be disabled during parallel entry.
