Functional Description

The 'AC/'ACT139 is a high-speed dual 1-of-4 decoder/demultiplexer. The device has two independent decoders, each of which accepts two binary weighted inputs (A_0 – A_1) and provides four mutually exclusive active-LOW outputs ($\bar{O}_0$ – $\bar{O}_3$). Each decoder has an active-LOW enable ($\bar{E}$). When $\bar{E}$ is HIGH all outputs are forced HIGH. The enable can be used as the data input for a 4-output demultiplexer application. Each half of the 'AC/'ACT139 generates all four minterms of two variables. These four minterms are useful in some applications, replacing multiple gate functions as shown in *Figure a*, and thereby reducing the number of packages required in a logic network.
