

74F537 1-of-10 Decoder with TRI-STATE® Outputs

General Description

The 'F537 is one-of-ten decoder/demultiplexer with four active HIGH BCD inputs and ten mutually exclusive outputs. A polarity control input determines whether the outputs are active LOW or active HIGH. The 'F537 has TRI-STATE outputs, and a HIGH signal on the Output Enable ($\overline{OE}$) input forces all outputs to the high impedance state. Two input

enables, active HIGH E_2 and active LOW $\overline{E}_1$, are available for demultiplexing data to the selected output in either non-inverted or inverted form. Input codes greater than BCD nine cause all outputs to go to the inactive state (i.e., same polarity as the P input).
