

DS1651/DS3651 Quad High Speed MOS Sense Amplifiers

General Description

The DS1651/DS3651 is TTL compatible high speed circuits intended for sensing in a broad range of MOS memory system applications. Switching speeds have been enhanced over conventional sense amplifiers by application of Schottky technology, and TRI-STATE® strobing is incorporated, offering a high impedance output state for bused organization. The DS1651/DS3651 has active pull-up outputs and offers open collector outputs providing implied "AND" operations.

Features

- High speed
- TTL compatible
- Input sensitivity — ± 7 mV
- TRI-STATE outputs for high speed buses
- Standard supply voltages — ± 5 V
- Pin and function compatible with MC3430

Note 1: Derate cavity package 10.1 mW/°C above 25°C; derate molded package 11.8 mW/°C above 25°C.

Note 2: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the device should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

Note 3: Unless otherwise specified min/max limits apply across the 0°C to +70°C range for the DS3651 and across the -55°C to +125°C range for the DS1651. All typical values are for $T_A = 25^\circ C$, $V_{CC} = 5V$ and $V_{EE} = -5V$.

Note 4: All currents into device pins shown as positive, out of device pins as negative, all voltages referenced to ground unless otherwise noted. All values shown as max or min on absolute value basis.

Note 5: Only one output at a time should be shorted.

Note 6: A parameter which is of primary concern when designing with sense amplifiers is, what is the minimum differential input voltage required at the sense amplifier input terminals to guarantee a given output logic state. This parameter is commonly referred to as threshold voltage. It is well known that design considerations of threshold voltage are plagued by input offset currents, bias currents, network source resistances, and voltage gain. As a design convenience, the DS1651 and DS3651 are specified to a parameter called input sensitivity (V_{IS}). This parameter takes into consideration input offset currents and bias currents, and guarantees a minimum input differential voltage to cause a given output logic state with respect to a maximum source impedance of 200Ω at each input.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
