#### MNLMC6462AM-X REV 1A1

#### PRECISION CMOS DUAL MICROPOWER OPERATIONAL AMPLIFIER

#### General Description

The LMC6462 is a dual low offset voltage amplifier, combining rail-to-rail Input and Output Range with very low power consumption. Performance characteristics include low input bias current, high voltage gain, rail-to-rail output swing, and an input common mode voltage range that exceeds both rails, operating at 3V, 5V, and 15V. The rail-to-rail output swing of the amplifier, for loads down to 25 KOhms, assures maximum dynamic signal range. These features, plus its low power consumption, make the LMC6462 ideally suited for battery powered applications.

The LMC6462 is an excellent upgrade for circuits using limited common-mode range amplifiers.

For designs that require higher speed, see the LMC6482 dual operational amplifier.

#### Features

- Low offset voltage. 500uV

- Ultra low supply current. 23uA/Amplifier

- Operates from 3V to 15V single supply.

- Low input bias current. 150fA typ.

- Rail-to-Rail Output Swing within 10mV of rail, Vs = 5V, 25k Ohm load.

#### Applications

- Battery Operated Circuits.
- Transducer Interface Circuits.
- Portable Communication Devices.
- Medical Application.
- Battery Monitoring.

 $3.0 \le V+ \le 15.5V$ 

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

- Note 1: Do not short circuit output to V+, when V+ is greater than 13V or reliability will be adversely affected.
- Vcm=7.5V and R1 connected to 7.5V. For Sourcing tests, 7.5V<=Vo<=11.5V. For Sinking tests, 3.5V<=Vo<=7.5V. Note 2:
- Note 3: Device configured as a voltage follower, with a 10V input step. For Positive Slew Vin swing is 2.5V to 12.5V, Vout is measured between 6.0V and 9.0V. For Negative Slew Vin is 12.5V to 2.5V, Vout is measured between 9.0V and 6.0V.

  Note 4: Limits are dictated by testing limitations and not device performance.
