

DUAL INPUT LOW DROPOUT REGULATOR

Features

- 450mV typ. Dropout at 3A in dual power voltage mode
- Remote Sense Pin Available
- 2% Accuracy Over Temperature Range
- Build-in Over Temperature Protection
- Build-in Current Limit
- 5 Pin TO-220, TO-252 and TO-263 Packages
- No Supply Sequencing Problems in Dual Supply Mode

Applications

- Microprocessor Supplies
- Chip Set Supplies
- VGA Card Power
- LCD Monitor Power

General Description

The APL1582 of high performance positive voltage regulators are designed for use in applications requiring very low dropout voltage at 3Amps .

The APL1582 can provide a output voltage at the range of 1.25V to 2.55V , where both 5V and 3.3V voltage supplies are available .

The superior dropout characteristics result in reduced heat dissipation compared to regular LDOs. The APL1582 also provides excellent regulation over line , load , and temperature variations.

Current limit is trimmed to ensure specified output current and controlled short-circuit current . On-chip thermal limiting provides protection against any combination of overload that would create excessive junction temperature .

The APL1582 is available in both the through-hole and surface mount versions of the industry standard 5-Pin TO-220, TO-252 and TO-263 power packages .

Pin Description

PIN		I/O	Description
No.	Name		
1	VSENSE	I	Positive side of the reference voltage, which allows remote sensing to obtain excellent load regulation.
2	ADJ	O	Negative side of the reference voltage, which allows to use resistor divider to set an expect output voltage. A small bypass capacitor can be connected from this pin to ground to improve PSRR performance.
3	VOUT	O	Output pin of the regulator, which connects to the TAB. A minimum of 10 μ F capacitor must be connected from this pin to ground to ensure the stability.
4	VCONTROL	I	Supply pin of the control circuitry, which must be always higher than VOUT for the device to regulate. (see electrical characteristics)
5	VIN	I	Power input pin of the regulator, which must be always higher than VOUT for the device to regulate. (see electrical characteristics)

Electrical Characteristics Cont.

Note 1 : Low duty cycle pulse test with Kelvin connections are required to maintain data accuracy .

Note 2 : Drop-out voltage is defined as the minimum difference between V_{IN} and V_{OUT} required to maintain 1% V_{OUT} regulation .

Note 3 : Minimum load current is defined as the minimum current required at the output to maintain V_{OUT} regulation.

Application Circuit

$$* V_{OUT} = V_{REF} (1 + R2 / R1) + I_{ADJ} * R2$$

* $R1$ is typically in range of 100Ω to 125Ω to satisfy the minimum load current requirement
