

December 1992

Features

- CD40192BMS - BCD Type
- CD40193BMS - Binary Type
- High Voltage Type (20V Rating)
- Individual Clock Lines for Counting Up or Counting Down
- Synchronous High-Speed Carry and Borrow Propagation Delays for Cascading
- Asynchronous Reset and Preset Capability
- Medium Speed Operation
 - $f_{CL} = 8\text{MHz}$ (typ.) at 10V
- 5V, 10V and 15V Parametric Ratings
- Standardize Symmetrical Output Characteristics
- 100% Tested for Quiescent Current at 20V
- Maximum Input Current of $1\mu\text{A}$ at 18V Over Full Package Temperature Range; 100nA at 18V and $+25^\circ\text{C}$
- Noise Margin (Over Full Package/Temperature Range)
 - 1V at $V_{DD} = 5\text{V}$
 - 2V at $V_{DD} = 10\text{V}$
 - 2.5V at $V_{DD} = 15\text{V}$
- Meets All Requirements of JEDEC Tentative Standard No. 13B, "Standard Specifications for Description of 'B' Series CMOS Devices"

Applications

- Up/Down Difference Counting
- Multistage Ripple Counting
- Synchronous Frequency Dividers
- A/D and D/A Conversion
- Programmable Binary or BCD Counting

Description

CD40192BMS Presetable BCD Up/Down Counter and the CD40193BMS Presetable Binary Up/Down Counter each consist of 4 synchronously clocked, gated "D" type flip-flops connected as a counter. The inputs consist of 4 individual jam lines, a $\overline{\text{PRESET}}$ $\overline{\text{ENABLE}}$ control, individual CLOCK UP and CLOCK DOWN signals and a master RESET. Four buffered Q signal outputs as well as CARRY and BORROW outputs for multiple-stage counting schemes are provided.

The counter is cleared so that all outputs are in a low state by a high on the RESET line. A RESET is accomplished asynchronously with the clock. Each output is individually programmable asynchronously with the clock to the level on the corresponding jam input when the $\overline{\text{PRESET}}$ $\overline{\text{ENABLE}}$ control is low.

The counter counts up one count on the positive clock edge of the CLOCK UP signal provided the CLOCK DOWN line is high. The counter counts down one count on the positive clock edge of the CLOCK DOWN signal provided the CLOCK UP line is high.

The $\overline{\text{CARRY}}$ and $\overline{\text{BORROW}}$ signals are high when the counter is counting up or down. The $\overline{\text{CARRY}}$ signal goes low one-half clock cycle after the counter reaches its maximum count in the count-up mode. The $\overline{\text{BORROW}}$ signal goes low one-half clock cycle after the counter reaches its minimum count in the count-down mode. Cascading of multiple packages is easily accomplished without the need for additional external circuitry by tying the BORROW and $\overline{\text{CARRY}}$ outputs to the CLOCK DOWN and CLOCK UP inputs, respectively, of the succeeding counter package.

The CD40192BMS and CD40193BMS are supplied in these 16-lead outline packages:

1. All voltages referenced to device GND.
2. The parameters listed on Table 3 are controlled via design or process and are not directly tested. These parameters are characterized on initial design release and upon design changes which would affect these characteristics.
3. CL = 50pF, RL = 200K, Input TR, TF < 20ns.
4. If more than one unit is cascaded, TRCL should be made less than or equal to the sum of the transition time and the fixed propagation delay of the output of the driving stage for the estimated capacitive load.
5. The time required for RESET or PRESET ENABLE control to be removed before clocking. See timing diagram defining TREM.
