

# Picoamp Input Current, Microvolt Offset, Low Noise Op Amp

## FEATURES

- Guaranteed Bias Current  
 $T_A = 25^\circ\text{C}$ : 100pA Max  
 $T_A = -55^\circ\text{C}$  to  $125^\circ\text{C}$ : 600pA Max
- Guaranteed Offset Voltage: 120 $\mu\text{V}$  Max
- Guaranteed Drift: 1.5 $\mu\text{V}/^\circ\text{C}$  Max
- Low Noise, 0.1Hz to 10Hz: 0.5 $\mu\text{V}_{\text{P-P}}$
- Guaranteed Low Supply Current: 600 $\mu\text{A}$  Max
- Guaranteed CMRR: 114dB Min
- Guaranteed PSRR: 114dB Min
- Guaranteed Voltage Gain with 5mA Load Current

## APPLICATIONS

- Precision Instrumentation
- Charge Integrators
- Wide Dynamic Range Logarithmic Amplifiers
- Light Meters
- Low Frequency Active Filters
- Standard Cell Buffers
- Thermocouple Amplifiers

## DESCRIPTION

The LT<sup>®</sup>1008 is a universal precision operational amplifier that can be used in practically all precision applications. The LT1008 combines for the first time, picoampere bias currents (which are maintained over the full  $-55^\circ\text{C}$  to  $125^\circ\text{C}$  temperature range), microvolt offset voltage (and low drift with time and temperature), low voltage and current noise, and low power dissipation. Extremely high common mode and power supply rejection ratios, and the ability to deliver 5mA load current with high voltage gain round out the LT1008's superb precision specifications.

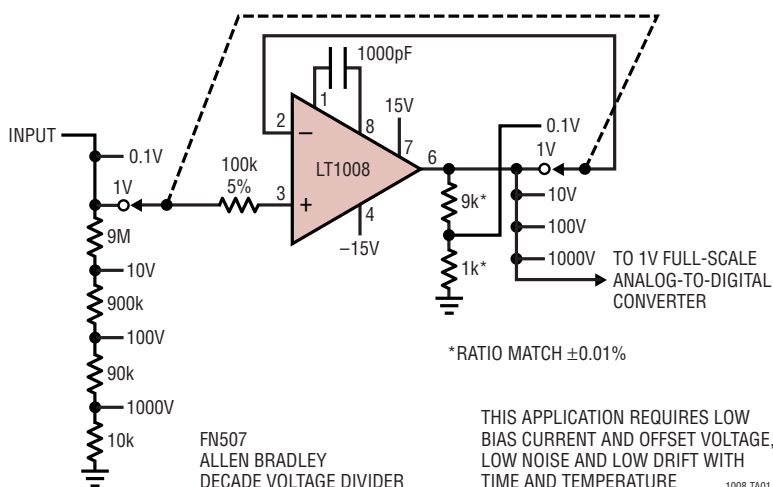

The all around excellence of the LT1008 eliminates the necessity of the time consuming error analysis procedure of precision system design in many applications; the LT1008 can be stocked as the universal precision op amp.

The LT1008 is externally compensated with a single capacitor for additional flexibility in shaping the frequency response of the amplifier. It plugs into and upgrades all standard LM108A/LM308A applications. For an internally compensated version with even lower offset voltage but otherwise similar performance see the LT1012.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

## TYPICAL APPLICATION

**Input Amplifier for 4.5 Digit Voltmeter**

**Input Bias Current vs Temperature**

1008 TA02

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** Differential input voltages greater than 1V will cause excessive current to flow through the input protection diodes unless current limiting resistors are used.

**Note 3:** These specifications apply for  $\pm 2V \leq V_S \leq \pm 20V$  ( $\pm 2.5V \leq V_S \leq \pm 20V$  over the temperature range) and  $-13.5V \leq V_{CM} \leq 13.5V$  (for  $V_S = \pm 15V$ ).

**Note 4:** 10Hz noise voltage density is sample tested on every lot. Devices 100% tested at 10Hz are available on request.

**Note 5:** This parameter is tested on a sample basis only.

## APPLICATIONS INFORMATION

### Achieving Picoampere/Microvolt Performance

In order to realize the picoampere—microvolt level accuracy of the LT1008, proper care must be exercised. For example, leakage currents in circuitry external to the op amp can significantly degrade performance. High quality insulation should be used (e.g., Teflon™, Kel-F); cleaning of all insulating surfaces to remove fluxes and other residues will probably be required. Surface coating may be necessary to provide a moisture barrier in high humidity environments.

Board leakage can be minimized by encircling the input circuitry with a guard ring operated at a potential close to that of the inputs: in inverting configurations the guard ring should be tied to ground, in noninverting connections to the inverting input at Pin 2. Guarding both sides of the printed circuit board is required. Bulk leakage reduction depends on the guard ring width. Nanoampere level leakage into the compensation terminals can affect offset voltage and drift with temperature.

Microvolt level error voltages can also be generated in the external circuitry. Thermocouple effects caused by temperature gradients across dissimilar metals at the contacts to the input terminals can exceed the inherent drift of the amplifier. Air currents over device leads should be minimized, package leads should be short, and the two input leads should be as close together as possible and maintained at the same temperature.

Teflon is a trademark of Dupont Company

The LT1008 is specified over a wide range of power supply voltages from ±2V to ±18V. Operation with lower supplies is possible down to ±1.2V (two Ni-Cad batteries).

### Test Circuit for Offset Voltage and Its Drift with Temperature

\* RESISTORS MUST HAVE LOW THERMOELECTRIC POTENTIAL  
THIS CIRCUIT IS ALSO USED AS THE BURN-IN CONFIGURATION FOR THE LT1008 WITH SUPPLY VOLTAGES INCREASED TO ±20V  
V<sub>O</sub> = 1000V<sub>OS</sub>

### Noise Testing

The 0.1Hz to 10Hz peak-to-peak noise of the LT1008 is measured in the test circuit shown. The frequency response of this noise tester indicates that the 0.1Hz corner is defined by only one zero. The test time to measure 0.1Hz to 10Hz noise should not exceed 10 seconds, as this time limit acts as an additional zero to eliminate noise contributions from the frequency band below 0.1Hz.

A noise voltage density test is recommended when measuring noise on a large number of units. A 10Hz noise voltage density measurement will correlate well with a 0.1Hz to 10Hz peak-to-peak noise reading since both results are determined by the white noise and the location of the 1/f corner frequency.

Current noise is measured in the circuit shown and calculated by the following formula where the noise of the source resistors is subtracted.

$$i_n = \frac{[e^2_{no} - (820nV)^2]^{1/2}}{40M\Omega \times 100}$$

## APPLICATIONS INFORMATION

### 0.1Hz to 10Hz Noise Test Circuit

### Frequency Compensation

The LT1008 is externally frequency compensated with a single capacitor. The two standard compensation circuits shown earlier are identical to the LM108A/LM308A frequency compensation schemes. Therefore, the LT1008 operational amplifiers can be inserted directly into LM108A/LM308A sockets, with similar AC and upgraded DC performance.

External frequency compensation provides the user with additional flexibility in shaping the frequency response of the amplifier. For example, for a voltage gain of ten and  $C_F = 3\text{pF}$ , a gain bandwidth product of 5MHz and slew rate of  $1.2\text{V}/\mu\text{s}$  can be realized. For closed-loop gains in excess of 200, no external compensation is necessary, and slew rate increases to  $4\text{V}/\mu\text{s}$ . The LT1008 can also be overcompensated (i.e.,  $C_F > 30\text{pF}$  or  $C_S > 100\text{pF}$ ) to improve capacitive load handling capability or to narrow noise bandwidth. In many applications, the feedback loop around the amplifier has gain (e.g., logarithmic amplifiers); overcompensation can stabilize these circuits with a single capacitor.

The availability of the compensation terminals permits the use of feedforward frequency compensation to enhance slew rate in low closed-loop gain configurations. The inverter slew rate is increased to  $1.4\text{V}/\mu\text{s}$ . The voltage follower feedforward scheme bypasses the amplifier's gain stages and slews at nearly  $10\text{V}/\mu\text{s}$ .

The inputs of the LT1008 are protected with back-to-back diodes. Current limiting resistors are not used, because the leakage of these resistors would prevent the realization of picoampere level bias currents at elevated temperatures.

In the voltage follower configuration, when the input is driven by a fast, large-signal pulse ( $>1\text{V}$ ), the input protection diodes effectively short the output to the input during slewing, and a current, limited only by the output short-circuit protection, will flow through the diodes.

The use of a feedback resistor, as shown in the voltage follower feedforward diagram, is recommended because this resistor keeps the current below the short-circuit limit, resulting in faster recovery and settling of the output.

## TYPICAL APPLICATION

Ammeter measures currents from 100pA to 100μA without the use of expensive high value resistors. Accuracy at

100μA is limited by the offset voltage between Q1 and Q2 and at 100pA by the inverting bias current of the LT1008.

Ammeter with Six Decade Range
