

## FEATURES

- Handles 10,000pF Capacitive Load
- 450 $\mu$ V Max Offset Voltage
- 1200 $\mu$ V Max Offset Voltage in S8 Package
- 50pA Bias Current at 70°C
- 13nV/ $\sqrt{\text{Hz}}$  Voltage Noise
- 4V/ $\mu$ s Slew Rate
- 4 $\mu$ V/ $^{\circ}\text{C}$  Drift
- 130dB Channel Separation

## APPLICATIONS

- Sample-and-Hold (Drives Large Hold Capacitors)
- A/D and D/A Converters
- Photodiode Amplifiers
- Voltage-to-Frequency Converters

## DESCRIPTION

The LT1457 is a dual, JFET input op amp optimized for handling large capacitive loads in combination with precision performance.

Precision specifications include 220 $\mu$ V offset voltage in plastic and surface mount packages. At 70°C input bias current is 50pA, input offset current is 20pA. Channel separation is 130dB.

Other dual JFET input op amps from Linear Technology include the LT1057, which is three times faster than the LT1457 but at the expense of significantly lower capacitive load handling capability; and the LT1113 with 4.5nV/ $\sqrt{\text{Hz}}$  voltage noise.

The ● denotes the specifications which apply over the full operating temperature range.

**Note 1:** Typical parameters are defined as the 60% yield of distributions of individual amplifiers; i.e., out of 100 LT1457s (200 op amps) typically 120 will be better than the indicated specification.

**Note 2:** This parameter is tested on a sample basis only.

**Note 3:** Current noise is calculated from the formula:  $i_n = (2qI_b)^{1/2}$ , where  $q = 1.6 \times 10^{-19}$  coulomb. The noise of source resistors up to 1G $\Omega$  swamps the contribution of current noise.

**Note 4:** This parameter is not 100% tested.

**Note 5:** Gain-Bandwidth product is not tested. It is guaranteed by design and by inference from the slew rate measurement.

**Note 6:** The LT1457 is not tested and not quality-assurance-sampled at  $-40^\circ C$  and at  $85^\circ C$ . These specifications are guaranteed by design, correlation, and/or inference from  $0^\circ C$ ,  $25^\circ C$ , and  $70^\circ C$  tests.

## APPLICATIONS INFORMATION

### Phase Reversal Protection

Most industry standard JFET input single, dual, and quad op amps (e.g., LF156, LF351, LF353, LF411, LF412, OP-15, OP-16, OP-215, and TL084) exhibit phase reversal at the output when the negative common-mode limit at the input is exceeded (i.e., below  $-12\text{V}$  with  $\pm 15\text{V}$  supplies). The photos show a  $\pm 16\text{V}$  sine wave input (A), the response

of an LF412A in the unity gain follower mode (B), and the response of the LT1457 (C).

The phase reversal of photo (B) can cause lock-up in servo systems. The LT1457 does not phase-reverse due to a unique phase reversal protection circuit.

## APPLICATIONS INFORMATION

### High Speed Operation

When the feedback around the op amp is resistive ( $R_F$ ), a pole will be created with  $R_F$ , the source resistance and capacitance ( $R_S, C_S$ ), and the amplifier input capacitance ( $C_{IN} \approx 4\text{pF}$ ). In low closed loop gain configurations and with  $R_S$  and  $R_F$  in the kilohm range, this pole can create excess phase shift and even oscillation on high speed amplifiers. Because the LT1457's phase margin is very high, this problem is minimal. However, a small capacitor ( $C_F$ ) in parallel with  $R_F$  eliminates this problem. With  $R_S(C_S + C_{IN}) = R_F C_F$ , the effect of the feedback pole is completely removed.

## PACKAGE DESCRIPTION

Dimension in inches (millimeters) unless otherwise noted.
