

Advanced Low Power 5V RS232 Transceiver with Small Capacitors

FEATURES

- **Low Cost**
- Uses Small Capacitors: 0.1 μ F, 0.2 μ F
- **1 μ A Supply Current in Shutdown**
- 120kbaud Operation for $R_L = 3k$, $C_L = 2500pF$
- **250kbaud Operation for $R_L = 3k$, $C_L = 1000pF$**
- CMOS Comparable Low Power: 40mW
- Operates from a Single 5V Supply
- Easy PC Layout: Flow-through Architecture
- Rugged Bipolar Design
- Outputs Assume a High Impedance State When Off or Powered Down
- Improved Protection: RS232 I/O Lines Can Be Forced to $\pm 25V$ Without Damage
- Output Overvoltage Does Not Force Current Back into Supplies
- Absolutely No Latch-Up
- Available in SO Package

APPLICATIONS

- Notebook Computers
- Palmtop Computers

DESCRIPTION

The LT[®]1537 is a three-driver, five-receiver RS232 transceiver, pin compatible with the LT1137A, offering performance improvements and two shutdown modes. The LT1537's charge pump is designed for extended compliance and can deliver over 35mA of load current. Supply current is typically 8mA, competitive with similar CMOS devices. An advanced driver output stage operates up to 250kbaud while driving heavy capacitive loads.

The LT1537 is fully compliant with all RS232 specifications. Special bipolar construction techniques protect the drivers and receivers beyond the fault conditions stipulated for RS232. Driver outputs and receiver inputs can be shorted to $\pm 25V$ without damaging the device or the power supply generator. In addition, the RS232 I/O pins are resilient to multiple $\pm 5kV$ ESD strikes.

The transceiver has two shutdown modes. One mode disables the drivers and the charge pump, the other shuts down all circuitry. While shut down, the drivers and receivers assume high impedance output states.

 LTC and LT are registered trademarks of Linear Technology Corporation.

The ● denotes specifications which apply over the operating temperature range ($0^\circ C \leq T_A \leq 70^\circ C$ for commercial grade and $-40^\circ C \leq T_A \leq 85^\circ C$ for industrial grade).

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 2: Testing done at $V_{CC} = 5V$ and $V_{ON/OFF} = 3V$. $C_1 = C_2 = 0.2\mu F$, $C^+ = C^- = 0.1\mu F$.

Note 3: Supply current is measured with driver and receiver outputs unloaded and the driver inputs tied high.

Note 4: Supply current and leakage current measurements in shutdown are performed with $V_{ON/OFF} = 0.1V$. Supply current measurements using DRIVER DISABLE are performed with $V_{DRIVER\ DISABLE} = 3V$.

Note 5: For driver delay measurements, $R_L = 3k$ and $C_L = 51pF$. Trigger points are set between the driver's input logic threshold and the output transition to the zero crossing ($t_{HL} = 1.4V$ to $0V$ and $t_{LH} = 1.4V$ to $0V$).

Note 6: For receiver delay measurements, $C_L = 51pF$. Trigger points are set between the receiver's input logic threshold and the output transition to standard TTL/CMOS logic threshold ($t_{HL} = 1.3V$ to $2.4V$ and $t_{LH} = 1.7V$ to $0.8V$).

Note 7: Absolute maximum externally applied voltage. Internal charge pump may force a larger value on this pin.

PIN FUNCTIONS

V_{CC}: 5V Input Supply Pin. Supply current drops to zero in the shutdown mode. This pin should be decoupled with a 0.1μF ceramic capacitor close to the package pin. Insufficient supply bypassing can result in low output drive levels and erratic charge pump operation.

GND: Ground Pin.

ON/OFF: TTL/CMOS Compatible Operating Mode Control. A logic LOW puts the device in the shutdown mode which reduces input supply current to zero and places all of the drivers and receivers in high impedance state. A logic HIGH fully enables the transceiver.

DRIVER DISABLE: This pin provides an alternate control for the charge pump and RS232 drivers. A logic HIGH on this pin shuts down the charge pump and places all drivers in a high impedance state. Receivers remain active under these conditions. Floating the driver disable pin or driving it to a logic LOW level fully enables the transceiver. A logic LOW on the On/Off pin supersedes the state of the Driver Disable pin. Supply current drops to 1.5mA when in DRIVER DISABLE mode.

V⁺: Positive Supply Output (RS232 Drivers). $V^+ \approx 2V_{CC} - 1.5V$. This pin requires an external charge storage capacitor $C \geq 0.1\mu F$, tied to ground or V_{CC} . Larger value capacitors may be used to reduce supply ripple. With multiple transceivers, the V^+ and V^- pins may be paralleled into common capacitors. For large numbers of transceivers, increasing the size of the shared common storage capacitors is recommended to reduce ripple.

V⁻: Negative Supply Output (RS232 Drivers). $V^- \approx -(2V_{CC} - 2.5V)$. This pin requires an external charge storage capacitor $C \geq 0.1\mu F$. V^- is short-circuit proof for 30 seconds.

C1⁺, C1⁻, C2⁺, C2⁻: Commutating Capacitor Inputs. These pins require two external capacitors $C \geq 0.2\mu F$: one from C1⁺ to C1⁻ and another from C2⁺ to C2⁻. To maintain charge pump efficiency, the capacitor's effective series resistance should be less than 2Ω. Low ESR ceramic capacitors work well in this application.

DRIVER IN: RS232 Driver Input Pins. These inputs are TTL/CMOS compatible. Inputs should not be allowed to float. Tie unused inputs to V_{CC} .

DRIVER OUT: Driver Outputs at RS232 Voltage Levels. Driver output swing meets RS232 levels for loads up to 3k. Slew rates are controlled for lightly loaded lines. Output current capability is sufficient for load conditions up to 2500pF. Outputs are in a high impedance state when in shutdown mode, $V_{CC} = 0V$ or when the driver disable pin is active. Outputs are fully short-circuit protected from $V^- + 25V$ to $V^+ - 25V$. Applying higher voltages will not damage the device if the overdrive is moderately current limited. Short circuits on one output can load the power supply generator and may disrupt the signal levels of the other outputs. The driver outputs are protected against ESD to ±5kV for human body model discharges.

PIN FUNCTIONS

RX IN: Receiver Inputs. These pins accept RS232 level signals ($\pm 25V$) into a protected 5k terminating resistor. The receiver inputs are protected against ESD to $\pm 5kV$ for human body model discharges. Each receiver provides 0.4V of hysteresis for noise immunity. Open receiver inputs assume a logic low state.

RX OUT: Receiver Outputs with TTL/CMOS Voltage Levels. Outputs are in a high impedance state when in shut-down mode to allow data line sharing. Outputs are fully short-circuit protected to ground or V_{CC} with the power on, off, or in shutdown mode.

ESD PROTECTION

The RS232 line inputs of the LT1537 have on-chip protection from ESD transients up to $\pm 5\text{kV}$ during shutdown or power ON state. The protection structures act to divert the static discharge safely to system ground. In order for the ESD protection to function effectively, the power supply and ground pins of the LT1537 must be connected to ground through low impedances. The power supply decoupling capacitors and charge pump storage capacitors provide this low impedance in normal application of the circuit. The only constraint is that low ESR capacitors must be used for bypassing and charge storage. ESD testing must be done with pins V_{CC} , V^+ , V^- and GND shorted to ground or connected with low ESR capacitors.
