

BIPOLAR ANALOG INTEGRATED CIRCUIT

μ PC3403

HIGH PERFORMANCE QUAD OPERATIONAL AMPLIFIER

DESCRIPTION

The μ PC3403 is monolithic Quad Operational Amplifier consists of four independent high-gain, internally frequency-compensated operational amplifiers, designed to operate from a single power supply or split power supplies over a wide range of voltages. The common mode input range includes the negative supply thereby eliminating the necessity for external biasing components in many applications.

FEATURES

- Internal frequency compensation
- Common mode input voltage range includes V^-
- Wide supply voltage range
3 V to 32 V (Single)
 ± 1.5 V to 16 V (Split)

Note 1. Reverse connection of supply voltage can cause destruction.

Note 2. The input voltage should be allowed to input without damage or destruction. Even during the transition period of supply voltage, power on/off etc., this specification should be kept. The normal operation will establish when the both inputs are within the Common Mode Input Voltage Range of electrical characteristics.

Note 3. This specification is the voltage which should be allowed to supply to the output terminal from external without damage or destructive. Even during the transition period of supply voltage, power on/off etc., this specification should be kept. The output voltage of normal operation will be the Output Voltage Swing of electrical characteristics.

Note 4. Thermal derating factor is -7.6 mW / °C when ambient temperature is higher than 50 °C.

Note 5. Thermal derating factor is -5.5 mW / °C when ambient temperature is higher than 25 °C.

Note 6. Pay careful attention to the total power dissipation not to exceed the absolute maximum ratings, Note 4 and Note 5.
