## Notes :

1. AC measurements assume  $t_T = 5\text{ns}$ .
2. Assumes that  $t_{\text{RCD}} \leq t_{\text{RCD(max)}}$  and  $t_{\text{RAD}} \leq t_{\text{RAD(max)}}$ . If  $t_{\text{RCD}}$  or  $t_{\text{RAD}}$  is greater than the maximum recommended value shown in this table,  $t_{\text{RAC}}$  exceeds the value shown.
3. Measured with a load circuit equivalent to 2 TTL loads and 100pF.
4. Assumes that  $t_{\text{RCD}} \geq t_{\text{RCD(max)}}$  and  $t_{\text{RAD}} \leq t_{\text{RAD(max)}}$ .
5. Assumes that  $t_{\text{RCD}} \leq t_{\text{RCD(max)}}$  and  $t_{\text{RAD}} \geq t_{\text{RAD(max)}}$ .
6.  $t_{\text{OFF(max)}}$  defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
7.  $V_{\text{IH(min)}}$  and  $V_{\text{IL(max)}}$  are reference levels for measuring timing of input signals. Also transition times are measured between  $V_{\text{IH}}$  and  $V_{\text{IL}}$ .
8. Operation with the  $t_{\text{RCD(max)}}$  limit insures that  $t_{\text{RAC(max)}}$  can be met.  $t_{\text{RCD(max)}}$  is specified as a reference point only: if  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD(max)}}$  limit, then access time is controlled exclusively by  $t_{\text{CAC}}$ .
9. Operation with the  $t_{\text{RAD(max)}}$  limit insures that  $t_{\text{RAC(max)}}$  can be met.  $t_{\text{RAD(max)}}$  is specified as a reference point only: if  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD(max)}}$  limit, then access time is controlled exclusively by  $t_{\text{AA}}$ .
10.  $t_{\text{WCS}}$ ,  $t_{\text{TRWD}}$ ,  $t_{\text{CWD}}$  and  $t_{\text{AWD}}$  are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only : if  $t_{\text{WCS}} \geq t_{\text{WCS(min)}}$ , the cycle is an early write cycle and the data out pin will remain open circuit(high impedance) throughout the entire cycle : if  $t_{\text{TRWD}} \geq t_{\text{TRWD(min)}}$ ,  $t_{\text{CWD}} \geq t_{\text{CWD(min)}}$  and  $t_{\text{AWD}} \geq t_{\text{AWD(min)}}$ , the cycle is a read-write and the data output will contain data read from the selected cell : if neither of the above sets of conditions is satisfied, the condition of the data out(at access time) is indeterminate.
11. These parameters are referenced to  $\overline{\text{CAS}}$  leading edge in early write cycles and to  $\overline{\text{WE}}$  leading edge in delayed write or Read-Modify-Write cycles.
12.  $t_{\text{RASC}}$  defines  $\overline{\text{RAS}}$  pulse width in Fast Page Mode cycles.
13. Access time is determined by the longer of  $t_{\text{AA}}$  or  $t_{\text{CAC}}$  or  $t_{\text{ACP}}$ .
14. An initial pause of 100  $\mu\text{s}$  is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing  $\overline{\text{RAS}}$  clock such as  $\overline{\text{RAS}}$  only refresh). If the internal refresh counter is used, a minimum of eight  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycles are required.
