

CD4512BC 8-Channel Buffered Data Selector

General Description

The CD4512BC buffered 8-channel data selector is a complementary MOS (CMOS) circuit constructed with N- and P-channel enhancement mode transistors. This data selector is primarily used as a digital signal multiplexer selecting 1 of 8 inputs and routing the signal to a 3-STATE output. A high level at the Inhibit input forces a low level at the output. A high level at the Output Enable ($\overline{OE}$) input forces the output into the 3-STATE condition. Low levels at both the Inhibit and ($\overline{OE}$) inputs allow normal operation.

Features

- Wide supply voltage range: 3.0V to 15V
- High noise immunity: $0.45 V_{DD}$ (typ.)
- 3-STATE output
- Low quiescent power dissipation:
0.25 μ W/package (typ.) @ $V_{CC} = 5.0V$
- Plug-in replacement for Motorola MC14512
