

FM809/810

3-Pin μ C Supervisor Circuits

General Description

The FM809/810 are supervisor circuits that monitor power supply or other system voltages and issue reset pulse whenever the voltage being monitored is out of tolerance. Once asserted, the reset pulse is guaranteed to be valid for a minimum of 140ms (256ms typical). FM809xx offers active low push-pull type of reset while FM810xx offers active high push-pull type. Several threshold voltages are offered to accommodate 5.0V, 3.3V, 3.0V and 2.7V system voltages.

The low supply current (typically 2 μ A) recommends FM809/810 devices for portable designs or wherever power saving is primary.

These devices are offered in space saving 3-pin SOT23 and SC70 packages.

Features

- V_{TH} voltages of 4.63V, 4.38V, 4.00V, 3.08V, 2.93V and 2.63V
- \overline{RESET} (FM809) or RESET (FM810) output

- 140ms power-on RESET delay (minimum)
- \overline{RESET} operation guaranteed to 1.0V
- Supply current only 2 μ A
- No external components
- Operating Range
 - -40°C to +105°C (SOT23)
 - -40°C to +85°C (SC70)
- SOT23-3 and SC70-3 packages

Applications

- Microcontrollers and Microprocessors
- Appliances
- Power-Supply Monitoring
- Portable Equipment
- Automotive Systems

Pin Descriptions

| Pin Number | Name | Function |
|------------|----------|--|
| 1 | GND | GROUND |
| 2 | RESET* | RESET (RESET) remains LOW (HIGH) while V_{CC} is below V_{TH} , and for at least 140ms after V_{CC} rises above V_{TH} . |
| 3 | V_{CC} | |

* with overbar, FM809 ($\overline{\text{RESET}}$); without, FM810 (RESET).

Circuit Timing (e.g.: FM809)

When operating properly with 5V in (for example), V_{OUT} will also be about 5V. When V_{IN} starts to fall, V_{OUT} will follow it down as shown. When V_{IN} drops below V_{TH} , V_{OUT} drops to ground ("issues a RESET") and stays there unless V_{IN} also falls below its minimum operating voltage, approx. 1V. At this point, the supervisor loses control, and its output may rise, only to again follow V_{IN} down to the ground.

When V_{IN} begins to rise, V_{OUT} follows it until 1.0V or so is reached, whereupon the device regains control, V_{OUT} is pulled to ground, etc. When V_{IN} rises above V_{TH} , V_{OUT} comes out of RESET 140 ms later.

If it is required that a lower value than $GND + 1.0V$ is needed on RESET signal during $V_{CC} \leq 1V$, a 100K resistor may be used on the device output (to GND for the FM809, to V_{CC} for the FM810).

Life Support Policy

Fairchild's products are not authorized for use as critical components in life support devices or systems without the express written approval of the President of Fairchild Semiconductor Corporation. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
