Gate Charge Test Circuit & Waveform

Resistive Switching Test Circuit & Waveforms

Unclamped Inductive Switching Test Circuit & Waveforms

The top diagram shows a circuit for testing the body diode of a MOSFET. A MOSFET (DUT) is connected with its source to ground and its drain to a load inductor L and a DC supply V_{DD} . The gate is driven by a pulse generator V_{GS} through a resistor R_G . A MOSFET (Driver) is used to drive the gate. The drain current I_{SD} is measured. The DUT and Driver are of the same type.

Key parameters and notes from the diagram:

- V_{DS} : Drain-Source Voltage
- I_{SD} : Source-Drain Current
- L : Load Inductor
- V_{DD} : DC Supply Voltage
- R_G : Gate Resistor
- V_{GS} : Gate-Source Voltage (Pulse)
- Same Type as DUT: Refers to the Driver MOSFET.
- dv/dt controlled by R_G
- I_{SD} controlled by pulse period

The bottom part of the image shows three waveforms:

- V_{GS} (Driver)**: A square wave pulse. The duty cycle is defined as $D = \frac{\text{Gate Pulse Width}}{\text{Gate Pulse Period}}$. The pulse height is 10V.
- I_{SD} (DUT)**: The source-drain current. It shows a forward current I_{FM} during the gate pulse, followed by a reverse current I_{RM} during the off-time. The reverse current is labeled "Body Diode Reverse Current". The slope of the reverse current is labeled di/dt .
- V_{DS} (DUT)**: The drain-source voltage. It shows a forward voltage drop V_{SD} during the on-state, followed by a recovery transient labeled "Body Diode Recovery dv/dt " during the off-state. The off-state voltage is V_{DD} .
