8-bit addressable latch

HEF4724B

MSI

DESCRIPTION

The HEF4724B is an 8-bit addressable latch with three address inputs (A_0 to A_2), a data input (D), an active LOW enable input ($\overline{E}$), an active HIGH clear input (CL), and eight parallel latch outputs (O_0 to O_7).

When $\overline{E}$ and CL are HIGH, all outputs (O_0 to O_7) are LOW. Eight-channel demultiplexing or active HIGH 1-of-8 decoding with output enable operation occurs when CL is HIGH and $\overline{E}$ is LOW. When CL and $\overline{E}$ are LOW, the

selected output (O_0 to O_7 ; determined by A_0 to A_2) follows D . When $\overline{E}$ goes HIGH, the contents of the latch are stored. When operating in the addressable latch mode ($\overline{E} = CL = \text{LOW}$), changing more than one bit of A_0 to A_2 could impose a transient wrong address. Therefore, this should only be done while in the memory mode ($\overline{E} = \text{HIGH}$, $CL = \text{LOW}$).

- HEF4724BP(N): 16-lead DIL; plastic (SOT38-1)
- HEF4724BD(F): 16-lead DIL; ceramic (cerdip) (SOT74)
- HEF4724BT(D): 16-lead SO; plastic (SOT109-1)
- (): Package Designator North America

PINNING

- A_0 to A_2 address inputs
- A data input
- $\overline{E}$ enable input (active LOW)
- CL clear input (active HIGH)
- O_0 to O_7 parallel latch outputs

Notes

- H = HIGH state (the more positive voltage)
 L = LOW state (the less positive voltage)
 X = state is immaterial
 O_{n-1} = state before the positive transition of $\bar{E}$
 D₁ = either HIGH or LOW

(1) The address to enable set-up time is the time before the HIGH to LOW enable transition that the address must be stable so that the correct latch is addressed and the other latches are not affected.

Fig.5 Waveforms showing minimum $\bar{E}$ and CL pulse widths, set-up times, hold times. Set-up and hold times are shown as positive values but may be specified as negative values.
