PHILIPS

Video analog input interface

TDA8708A

FEATURES

- 8-bit resolution
- Sampling rate up to 32 MHz
- Binary or two's complement 3-state TTL outputs
- TTL-compatible digital inputs and outputs
- Internal reference voltage regulator
- Power dissipation of 365 mW (typical)
- Input selector circuit (one out of three video inputs)
- Clamp and Automatic Gain Control (AGC) functions for CVBS and Y signals
- No sample-and-hold circuit required.
- The TDA8708A has white peak control in modes 1 and 2 whereas the TDA8708B has control in mode 1 only.

APPLICATIONS

- Video signal decoding
- Scrambled TV (encoding and decoding)
- Digital picture processing
- Frame grabbing.

GENERAL DESCRIPTION

The TDA8708A is an analog input interface for video signal processing. It includes a video amplifier with clamp and gain control, an 8-bit analog-to-digital converter (ADC) with a sampling rate of 32 MHz and an input selector.

GATE A	27	sync level synchronization pulse
RPEAK	28	peak level current resistor input

Video analog input interface

TDA8708A

FUNCTIONAL DESCRIPTION

The TDA8708A provides a simple interface for decoding video signals.

The TDA8708A operates in configuration mode 1 (see Fig.4) when the video signals are weak (i.e. when the gain of the AGC amplifier has not yet reached its optimum value). This enables a fast recovery of the synchronization pulses in the decoder circuit. When the pulses at the GATE A and GATE B inputs become distinct (GATE A and GATE B pulses are synchronization pulses occurring during the sync period and rear porch respectively) the TDA8708A automatically switches to configuration mode 2 (see Fig.5).

When the TDA8708A is in configuration mode 1, the gain of the AGC amplifier will be roughly adjusted (sync level to a digital output level of 0 and the peak level to a digital output level of 255).

In configuration mode 2 the digital output of the ADC is compared to internal digital reference levels. The resultant outputs control the charge or discharge current of a capacitor connected to the AGC pin. The voltage across this capacitor controls the gain of the video amplifier. This is the gain control loop.

The sync level comparator is active during a positive-going pulse at the GATE A input. This means that the sync pulse of the composite video signal is used as an amplitude reference. The bottom of the sync pulse is adjusted to obtain a digital output of logic 0 at the converter output. As the black level is at digital level 64, the sync pulse will have a digital amplitude of 64 LSBs.

The peak-white control loop is always active. If the video signal tends to exceed the digital code of 248, the gain will be limited to avoid any over-range of the converter.

The use of nominal signals will prevent the output from exceeding a digital code of 213 and the peak-white control loop will be non-active.

The clamp level control is accomplished by using the same techniques as used for the gain control. The black-level digital comparator is active during a positive-going pulse at the GATE B input. The clamp capacitor will be charged or discharged to adjust the digital output to code 64.

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	MIN.	MAX.	UNIT

Video analog input interface

TDA8708A

Notes

- 0 dB is obtained at the AGC amplifier when applying $V_{i(p-p)} = 1.33$ V.
- The output current at pin 19 should not exceed 1 mA. The load impedance R_L should be referenced to V_{CCA} and defined as:
 - AC impedance ≥ 1 k Ω and the DC impedance > 2.7 k Ω .
 - The load impedance should be coupled directly to the output of the amplifier so that the DC voltage supplied by the clamp is not disturbed.

- Control mode 2 is selected.
- Signal-to-noise ratio measured with 5 MHz bandwidth:

$$\frac{S}{N} = 20 \log \frac{V_{ANOUTC(p-p)}}{V_{ANOUTY(RMS\ noise)}} \text{ at } B = 5 \text{ MHz.}$$

- The voltage ratio is expressed as:

$$SVRR1 = 20 \log \frac{\Delta V_{CCA}}{V_{CCA}} \times \frac{G}{\Delta G} \text{ for } V_I = 1 \text{ V (p-p), gain at 100 kHz} = 1 \text{ and 1 V supply variation.}$$

- It is recommended that the rise and fall times of the clock are ≥ 2 ns. In addition, a 'good layout' for the digital and analog grounds is recommended.
- These measurements are realized on analog signals after a digital-to-analog conversion (TDA8702 is used).
- The supply voltage rejection is the relative variation of the analog signal (full-scale signal at input) for 1 V of supply variation:

$$SVRR2 = \frac{\Delta(V_{I(00)} - V_{I(FF)}) + (V_{I(00)} - V_{I(FF)})}{\Delta V_{CCA}}$$

- Full-scale sine wave ($f_i = 4.4$ MHz; $f_{clk} = 27$ MHz).

APPLICATION INFORMATION

Additional information can be found in the laboratory report "FBL/AN9308".

(1) It is recommended to decouple V_{CCO} through a 22 Ω resistor especially when the output data of TDA8708A interfaces with a capacitive CMOS load device.

(2) See Figs 13 and 15 for examples of the low-pass filters.

Fig.12 Application diagram.

Video analog input interface

TDA8708A

This filter can be adapted to various applications with respect to performance requirements. An input and output impedance of at least 680 Ω and 2.2 k Ω must in any event be applied.

PACKAGE OUTLINES

Video analog input interface

TDA8708A

Video analog input interface

TDA8708A

SOLDERING

Plastic dual in-line packages

BY DIP OR WAVE

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 s. The total contact time of successive solder waves must not exceed 5 s.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron below the seating plane (or not more than 2 mm above it). If its temperature is below 300 °C, it must not be in contact for more than 10 s; if between 300 and 400 °C, for not more than 5 s.

Plastic small-outline packages

BY WAVE

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 s, if allowed to cool to less than 150 °C within 6 s. Typical dwell time is 4 s at 250 °C.

A modified wave soldering technique is recommended using two solder waves (dual-wave), in which a turbulent wave with high upward pressure is followed by a smooth laminar wave. Using a mildly-activated flux eliminates the need for removal of corrosive residues in most applications.

BY SOLDER PASTE REFLOW

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 s according to method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 min at 45 °C.

REPAIRING SOLDERED JOINTS (BY HAND-HELD SOLDERING IRON OR PULSE-HEATED SOLDER TOOL)

Fix the component by first soldering two, diagonally opposite, end pins. Apply the heating tool to the flat part of the pin only. Contact time must be limited to 10 s at up to 300 °C. When using proper tools, all other pins can be soldered in one operation within 2 to 5 s at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages.)

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to the substrate by dipping or by an extra thick tin/lead plating before package placement.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
