Overview

The DN6852 is an integrated circuit making use of Hall effects. It is designed particularly for operating at a low supply voltage in one way magnetic field. It is suitable for various sensors and contactless switches.

Features

- Wide range of supply voltage : 3.6 to 16V
- Operating in one way magnetic field.
- TTL and MOS ICs directly drivable by output
- Semipermanent service life because of no contact parts
- Drivable with a small magnet
- 3-pin SIL plastic package (3-SIP)
- Open collector

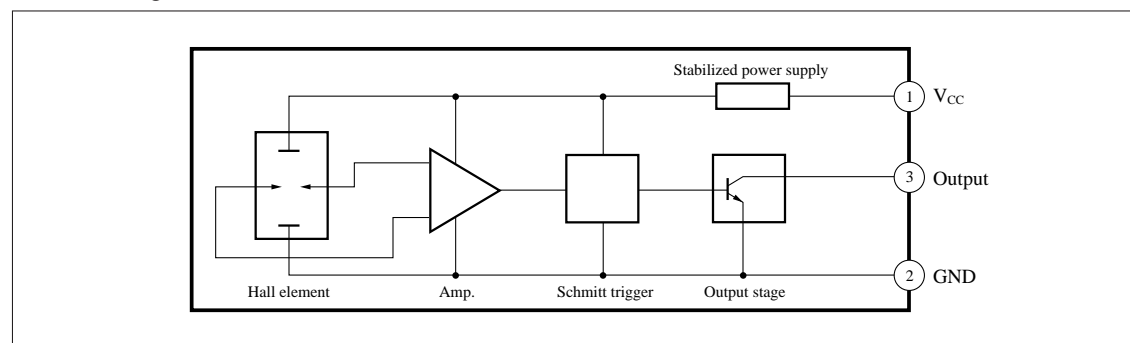

Applications

- Speed sensors
- Position sensors
- Rotation sensors
- Keyboard switches
- Microswitches

Note) This IC is not suitable for car electrical equipments.

■ Precaution on Use

1. Change of the operation magnetic flux density dose not depend on the supply voltage,
because the stabilization power supply is built-in.
(only for the range ; V_{CC}=4.5 to 16V)
2. Change from “H” to “L” level increases the supply current by approx. 1mA.
