

# SOT Temperature Sensor with Multidrop Single-Wire Digital Interface

MAX6575L/H

## General Description

The MAX6575L/H is a low-cost, low-current temperature sensor with a single-wire digital interface. It features accuracy of  $\pm 3^{\circ}\text{C}$  at  $+25^{\circ}\text{C}$ ,  $\pm 4.5^{\circ}\text{C}$  at  $+85^{\circ}\text{C}$ , and  $\pm 5^{\circ}\text{C}$  at  $+125^{\circ}\text{C}$ . The MAX6575L/H is a monostable, externally triggered temperature sensor that allows a microprocessor ( $\mu\text{P}$ ) to interface with up to eight temperature sensors using a single control line. Temperatures are sensed by measuring the time delay between the falling edge of the external triggering pulse and the falling edge of the subsequent pulse delays reported from the devices. Different sensors on the same I/O line use different timeout multipliers to avoid overlapping signals.

The MAX6575L/H features eight different timeout multipliers; these are selectable by using the two time-select pins on each device and choosing the "L" or "H" version. The "L" version provides four delay ranges less than 50ms. The "H" version provides four delay ranges greater than 50ms. The MAX6575L/H is available in a space-saving 6-pin SOT23 package.

## Applications

- Critical  $\mu\text{P}$  and  $\mu\text{C}$  Temperature Monitoring
- Portable Battery-Powered Equipment
- Cell Phones
- Battery Packs
- Hard Drives/Tape Drives
- Networking and Telecom Equipment
- Medical Equipment
- Automotive

## Features

- ◆ Simple Single-Wire Interface to  $\mu\text{P}$  or  $\mu\text{C}$
- ◆ Multidrop up to Eight Sensors on One Wire
- ◆  $\pm 0.8^{\circ}\text{C}$  Accuracy at  $+25^{\circ}\text{C}$  ( $\pm 3^{\circ}\text{C}$  max)
- ◆ Operates from  $+2.7\text{V}$  to  $+5.5\text{V}$  Supply Voltage
- ◆ Low  $150\mu\text{A}$  (typ) Supply Current
- ◆ Standard Operating Temperature Range:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- ◆ Small 6-Pin SOT23 Package

## Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE	SOT TOP MARK
MAX6575LZUT	$-40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$	6 SOT23	AABG
MAX6575HZUT	$-40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$	6 SOT23	AABH

## Selector Guide

PART	TIMEOUT MULTIPLIERS ( $\mu\text{s}/^{\circ}\text{K}$ )
MAX6575L	5, 20, 40, 80
MAX6575H	160, 320, 480, 640

Pin Configurations appear at end of data sheet.

## Typical Operating Circuit

# SOT Temperature Sensor with Multidrop Single-Wire Digital Interface

## ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)

V <sub>DD</sub> .....	-0.3V to +6V
TS1, TS0 .....	-0.3V to (V <sub>DD</sub> + 0.3V)
I/O .....	-0.3V to +6V
Input/Output Current, All Pins .....	±20mA

Continuous Power Dissipation (T<sub>A</sub> = +70°C)

6-Pin SOT23 (derate 7.10mW/°C above +70°C) .....	571mW
Operating Temperature Range .....	-40°C to +125°C
Storage Temperature Range .....	-65°C to +150°C
Lead Temperature (soldering, 10sec) .....	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>DD</sub> = +2.7V to +5.5V, T<sub>A</sub> = -40°C to +125°C, unless otherwise noted. Typical values are specified at T<sub>A</sub> = +25°C and V<sub>DD</sub> = +5V, unless otherwise noted.)

## Pin Description

PIN	NAME	FUNCTION
1	$V_{DD}$	Positive Supply Voltage
2	GND	Ground
3	N.C.	No Connect. Connect pin to GND or leave open.
4, 5	TS0, TS1	Time-Select Pins. Set the time delay factor by connecting TS1 and TS0 to either $V_{DD}$ or GND. See Table 1.
6	I/O	Bidirectional Interface Pin. A time delay between when the part is initiated externally by pulling I/O low and when the part subsequently pulls I/O low, is proportional to absolute temperature ( $^\circ K$ ).

# SOT Temperature Sensor with Multidrop Single-Wire Digital Interface

## Detailed Description

The MAX6575L/H low-cost, low-current (150 $\mu$ A typ) temperature sensor is ideal for interfacing with micro-controllers or microprocessors. The MAX6575L/H is a monostable, externally triggered temperature sensor that uses a Temp $\rightarrow$ Delay conversion to communicate with a  $\mu$ P over a single I/O line. Time-select pins (TS1, TS0) permit the internal temperature-controlled oscillator (TCO) to be scaled by four preset timeout multipliers, allowing eight separate temperature sensors to share one I/O line. Different sensors on the same I/O line will use different timeout multipliers to avoid overlapping signals.

### Operating the MAX6575L/H

Figure 1 illustrates the timing for the MAX6575L/H. When the device is powered up, it assumes a ready state where it awaits an external trigger at the I/O pin. The I/O pin of the MAX6575L/H has an open-drain output structure that requires a pull-up resistor to maintain the proper logic levels. Once the I/O pin is pulled low and then released, control of the I/O pin is transferred to the MAX6575L/H. The temperature conversion begins on the falling edge of the externally triggered pulse. The I/O line is pulled low at a later time. That time is determined by the device temperature and the Time Select pins (TS1, TS0). The I/O line remains low for 5T $\mu$ s, where T is the temperature in degrees Kelvin. The temperature of the device is represented by the edge-to-edge delay of the externally triggered pulse and the falling edge of the subsequent pulse originating from the device. The device can be manually reset by pulling the I/O line low for more than t<sub>RESET</sub> (16ms max). The device will automatically reset after a maxi-

**Table 1. Time-Select Pin Configuration**

TIME-SELECT PINS		TIMEOUT MULTIPLIERS ( $\mu$ s/ $^{\circ}$ K)	
TS1	TS0	MAX6575L	MAX6575H
GND	GND	5	160
GND	V <sub>DD</sub>	20	320
V <sub>DD</sub>	GND	40	480
V <sub>DD</sub>	V <sub>DD</sub>	80	640

mum delay of 520ms, at which point it will again be in a ready state awaiting a start pulse.

Definition of Terms:

t<sub>RESET</sub>: Time I/O must be externally pulled low to guarantee the MAX6575L/H is in a ready state awaiting external trigger. (Part will assume a ready state after 520ms without a reset pulse.)

t<sub>SETUP</sub>: Time I/O must be high prior to a start pulse.

t<sub>START</sub>: Trigger pulse which starts the on-chip timing sequence on its falling edge.

t<sub>Dx</sub>: Timing delay between the falling edge of the start pulse and the falling edge initiated by CHIP#x.

t<sub>Lx</sub>: I/O pulse low time (5T $\mu$ s).

t<sub>READY</sub>: Time after falling edge of start pulse when the MAX6575L/H will reset itself and await the next external trigger.

The temperature, in degrees Celsius, may be calculated as follows:

$$T(^{\circ}\text{C}) = [t_{Dx}(\mu\text{s}) / \text{timeout multiplier}(\mu\text{s}/^{\circ}\text{K})] - 273.15^{\circ}\text{K}$$

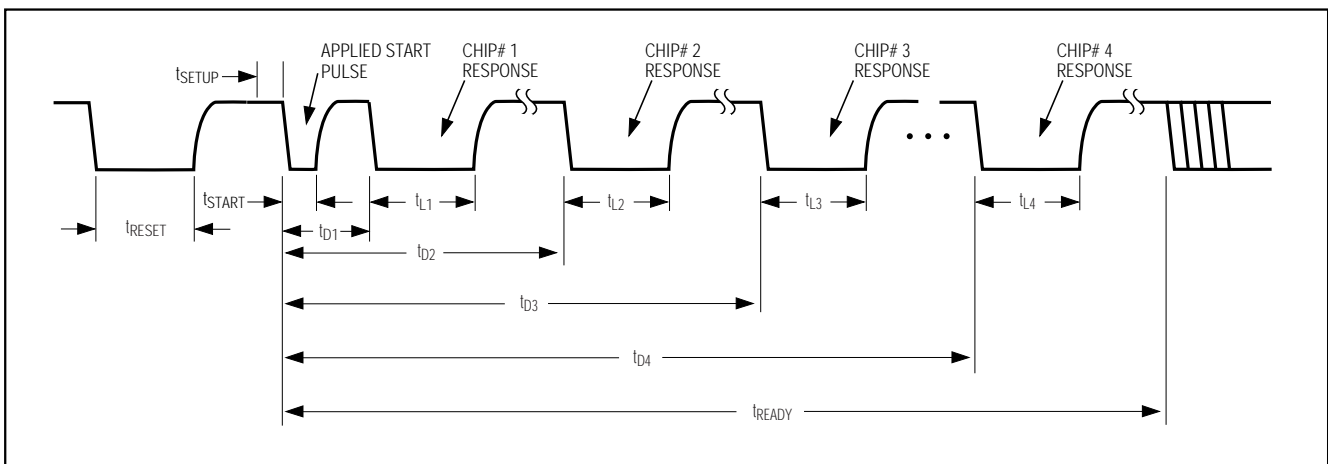

Figure 1. Timing Diagram

### Time-Select Pins (TS1, TS0)

Table 1 shows the configuration of the Time-select pins for the MAX6575L/H. Each device allows four selectable timeout multipliers intended to prevent overlapping when multiple devices are used on the same I/O line. Tie TS1 and TS0 to either GND or VDD to select the desired temperature multiplier.

To monitor several chips on the same I/O line, different timeout multipliers should be selected using the TS1 and TS0 pins. The timeout periods are then scaled so that the response times will not overlap (see *Timeout Selection*).

## Applications Information

### Timeout Selection

Under extreme temperature conditions, it is possible for an overlap to occur between the timeout delays of different sensors in a multidrop configuration. This overlap can occur only if the temperature differential recorded between two devices is very large. Timeout overlaps can be avoided in multidrop configurations by selecting the appropriate timeout multipliers. Table 2 illustrates the allowable temperature differential between devices when the maximum error is present on each device. Allowable temperature differentials greater than 165°C indicate no overlap.

For example, if the maximum temperature differential in a system is 80°C, the only combinations of timeout multipliers that could result in timeout overlap would be a 320:480µs/°K (70.2°C) or a 480:640µs/°K (37.9°C) combination. As long as these combinations of timeout multipliers are not used in the same multidrop configuration, no overlap can occur. Thus, seven MAX6575L/H parts can be used in the same multidrop configuration if the maximum temperature differential between parts is 80°C. A similar analysis shows that four MAX6575L/H parts can be used when the maximum temperature differential extends over the entire 165°C range of the part.

### Noise Considerations

The accuracy of the MAX6575L/H timeout delay is susceptible to noise generated both internally and externally. The effects of external noise can be minimized by placing a 0.1µF ceramic bypass capacitor close to the device's supply pin. Internal noise is inherent in the operation of the device and is detailed in Table 3. Internal averaging minimizes the effect of this noise when using longer timeout multipliers. The effects of this noise are included in the overall accuracy of the device as specified in the *Electrical Characteristics* table.

# SOT Temperature Sensor with Multidrop Single-Wire Digital Interface

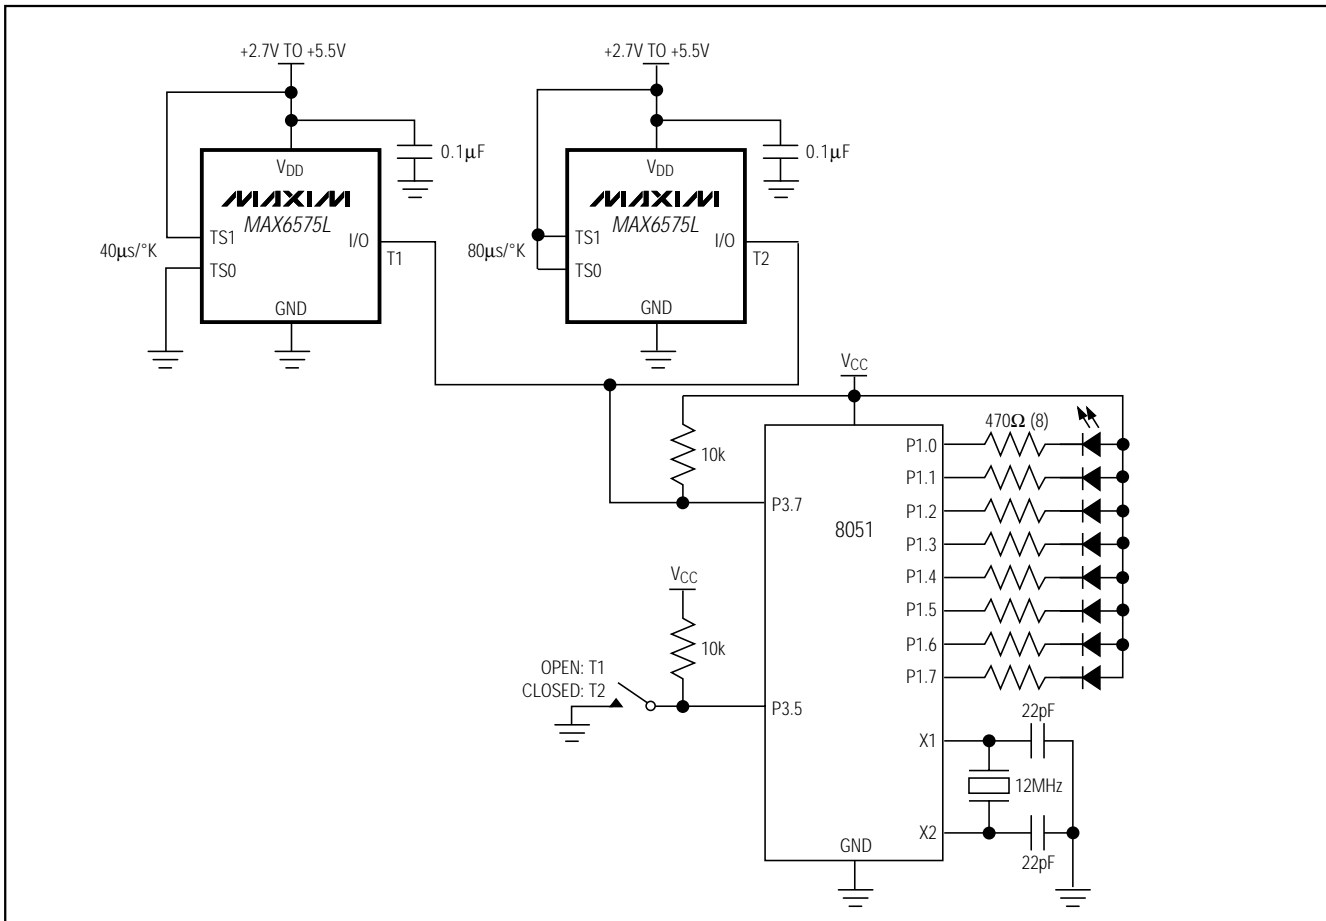

Figure 2. Interfacing Multiple Devices with a Microcontroller

## Interfacing Multiple Devices with a Microcontroller

Figure 2 shows how to interface multiple MAX6575L/H devices with an 8051 microcontroller. The first device, T1, is configured for a timeout multiplier of  $40\mu\text{s}/^\circ\text{K}$ , while the second device, T2, is configured for a timeout multiplier of  $80\mu\text{s}/^\circ\text{K}$  to avoid overlap. The microcontroller takes in temperature values from both sensors, T1 and T2, on a single port pin, P3.7. The microcontroller displays five times the temperature in degrees Celsius in binary on Port 1. A switch connected to a pull-up resistor at Port 3.5 selects which temperature is displayed: open = T1, closed = T2. Code is provided for this application as Listing 1.
