

NE556 SA556 - SE556

GENERAL PURPOSE DUAL BIPOLAR TIMERS

- LOW TURN OFF TIME
- MAXIMUM OPERATING FREQUENCY GREATER THAN 500kHz
- TIMING FROM MICROSECONDS TO HOURS
- OPERATES IN BOTH ASTABLE AND MONOSTABLE MODES
- HIGH OUTPUT CURRENT CAN SOURCE OR SINK 200mA
- ADJUSTABLE DUTY CYCLE
- TTL COMPATIBLE
- TEMPERATURE STABILITY OF 0.005% PER°C

DESCRIPTION

The NE556 dual monolithic timing circuit is a highly stable controller capable of producing accurate time delays or oscillation. In the time delay mode of operation, the time is precisely controlled by one external resistor and capacitor. For a stable operation as an oscillator, the free running frequency and the duty cycle are both accurately controlled with two external resistors and one capacitor.

The circuit may be triggered and reset on falling waveforms, and the output structure can source or sink up to 200mA.

ORDER CODE

Part Number	Temperature Range	Package	
		N	D
NE556	0°C, 70°C	•	•
SA556	-40°C, 105°C	•	•
SE556	-55°C, 125°C	•	•

N = Dual in Line Package (DIP)
D = Small Outline Package (SO) - also available in Tape & Reel (DT)

	$V_{CC} = +5\text{V}$, $I_{dis} = 4.5\text{mA}$		80	200		80	200	
t_r	Output rise Time		100	200		100	300	ns
t_f	Output Fall Time		100	200		100	300	
t_{off}	Turn off Time - note ⁶⁾ ($V_{reset} = V_{CC}$)		0.5			0.5		μs

1. Supply current when output is high is typically 1mA less.

2. Tested at $V_{CC} = +5\text{V}$ and $V_{CC} = +15\text{V}$

3. This will determine the maximum value of $R_A + R_B$ for +15V operation the max total is $R = 20\text{M}\Omega$ and for 5V operation the max total $R = 3.5\text{M}\Omega$

4. Specified with trigger input high

5. No protection against excessive pin 7 current is necessary, providing the package dissipation rating will not be exceeded

6. Time measured from a positive going input pulse from 0 to $0.8 \times V_{CC}$ into the threshold to the drop from high to low of the output trigger is tied to threshold.

TYPICAL APPLICATION

50% DUTY CYCLE OSCILLATOR

$$t_1 = 0.693 R_A \cdot C$$

$$t_2 = [(R_A R_B)/(R_A + R_B)] C \ln \left[\frac{R_B - 2R_A}{2R_B - R_A} \right]$$

$$f = \frac{t_1}{t_1 + t_2} \quad R_B < \frac{1}{2} R_A$$

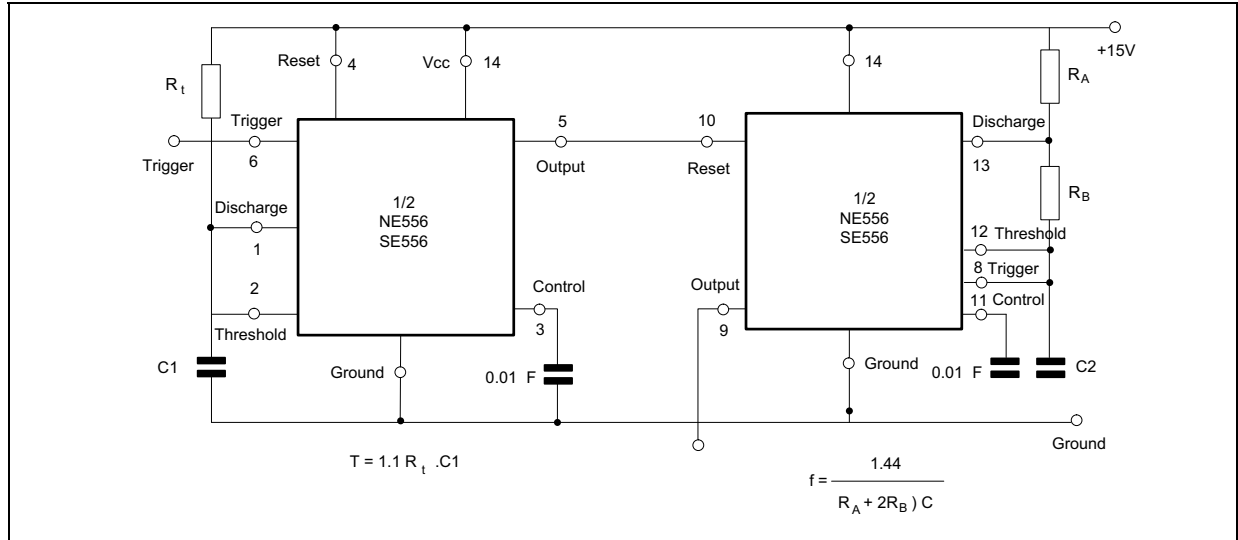

PULSE WIDTH MODULATOR

TONE BURST GENERATOR

For a tone burst generator the first timer is used as a monostable and determines the tone duration when triggered by a positive pulse at pin 6. The second timer is enabled by the high output of the monostable. It is connected as an astable and determines the frequency of the tone.

MONOSTABLE OPERATION

ASTABLE OPERATION

$t_1 = 0.693 (R_A + R_B) C$ Output High
 $t_2 = 0.693 R_B C$ Output Low
