128K x 36 Synchronous Flow-Through 3.3V Cache RAM

Features

- **Supports 117-MHz microprocessor cache systems with zero wait states**
- **128K by 36 common I/O**
- **Fast clock-to-output times**
  - **7.5 ns (117-MHz version)**
- **Two-bit wrap-around counter supporting either interleaved or linear burst sequence**
- **Separate processor and controller address strobes provide direct interface with the processor and external cache controller**
- **Synchronous self-timed write**
- **Asynchronous output enable**
- **Supports 3.3V & 2.5V I/O levels**
- **JEDEC-standard pinout**
- **100-pin TQFP packaging**
- **ZZ "sleep" mode**

Functional Description

The CY7C1345 is a 3.3V, 128K by 36 synchronous cache RAM designed to interface with high-speed microprocessors with minimum glue logic. Maximum access delay from clock rise is 7.5 ns (117-MHz version). A 2-bit on-chip counter captures the first address in a burst and increments the address automatically for the rest of the burst access.

The CY7C1345 allows either interleaved or linear burst sequences, selected by the MODE input pin. A HIGH selects an interleaved burst sequence, while a LOW selects a linear burst sequence. Burst accesses can be initiated with the Processor Address Strobe (ADSP) or the cache Controller Address Strobe (ADSC) inputs. Address advancement is controlled by the address advancement (ADV) input.

A synchronous self-timed write mechanism is provided to simplify the write interface. A synchronous chip enable input and an asynchronous output enable input provide easy control for bank selection and output three-state control.

Pin Descriptions

Pin Number	Name	I/O	Description
85	$\overline{ADSC}$	Input-Synchronous	Address Strobe from Controller, sampled on the rising edge of CLK. When asserted LOW, $A_{[15:0]}$ is captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When $\overline{ADSP}$ and $\overline{ADSC}$ are both asserted, only $\overline{ADSP}$ is recognized.
84	$\overline{ADSP}$	Input-Synchronous	Address Strobe from Processor, sampled on the rising edge of CLK. When asserted LOW, $A_{[15:0]}$ is captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When $\overline{ADSP}$ and $\overline{ADSC}$ are both asserted, only $\overline{ADSP}$ is recognized. $\overline{ASDP}$ is ignored when $\overline{CE}_1$ is deasserted HIGH.
36, 37	$A_{[1:0]}$	Input-Synchronous	A_1, A_0 Address Inputs. These inputs feed the on-chip burst counter as the LSBs as well as being used to access a particular memory location in the memory array.
49 –44, 81–82, 99–100, 32–35	$A_{[16:2]}$	Input-Synchronous	Address Inputs used in conjunction with $A_{[1:0]}$ to select one of the 64K address locations. Sampled at the rising edge of the CLK, if $\overline{CE}_1$, CE_2, and $\overline{CE}_3$ are sampled active, and $\overline{ADSP}$ or $\overline{ADSC}$ is active LOW.
96–93	$\overline{BW}_{[3:0]}$	Input-Synchronous	Byte Write Select Inputs, active LOW. Qualified with $\overline{BWE}$ to conduct byte writes. Sampled on the rising edge. $\overline{BW}_0$ controls $DQ_{[7:0]}$ and DP_0, $\overline{BW}_1$ controls $DQ_{[15:8]}$ and DP_1, $\overline{BW}_2$ controls $DQ_{[23:16]}$ and DP_2, and $\overline{BW}_3$ controls $DQ_{[31:24]}$ and DP_3. See Write Cycle Description table for further details.
83	$\overline{ADV}$	Input-Synchronous	Advance Input, used to advance the on-chip address counter. When LOW the internal burst counter is advanced in a burst sequence. The burst sequence is selected using the MODE input.
87	$\overline{BWE}$	Input-Synchronous	Byte Write Enable Input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
88	$\overline{GW}$	Input-Synchronous	Global Write Input, active LOW. Sampled on the rising edge of CLK. This signal is used to conduct a global write, independent of the state of $\overline{BWE}$ and $\overline{BW}_{[3:0]}$. Global writes override byte writes.
89	CLK	Input-Clock	Clock Input. Used to capture all synchronous inputs to the device.
98	$\overline{CE}_1$	Input-Synchronous	Chip Enable 1 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE_2 and $\overline{CE}_3$ to select/deselect the device. $\overline{CE}_1$ gates $\overline{ADSP}$.
97	CE_2	Input-Synchronous	Chip Enable 2 Input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_3$ to select/deselect the device.
92	$\overline{CE}_3$	Input-Synchronous	Chip Enable 3 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and CE_2 to select/deselect the device.
86	$\overline{OE}$	Input-Asynchronous	Output Enable, asynchronous input, active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are three-stated, and act as input data pins.
64	ZZ	Input-Asynchronous	Snooze Input. Active HIGH asynchronous. When HIGH, the device enters a low-power standby mode in which all other inputs are ignored, but the data in the memory array is maintained.Leaving ZZ floating or NC will default the device into an active state. ZZ pin has an internal pull-down.
31	MODE	-	Mode Input. Selects the burst order of the device. Tied HIGH selects the interleaved burst order. Pulled LOW selects the linear burst order. When left floating or NC, defaults to interleaved burst order. Mode pin has an internal pull-up.
30–28, 25–22, 19–18, 13–12, 9–6, 3–1, 80–78, 75–72, 69–68, 63–62, 59–56, 53–51	$DQ_{[31:0]}$, $DP_{[3:0]}$	I/O-Synchronous	Bidirectional Data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by $A_{[16:0]}$ during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{OE}$ in conjunction with the internal control logic. When $\overline{OE}$ is asserted LOW, the pins behave as outputs. When HIGH, $DQ_{[31:0]}$ and $DP_{[3:0]}$ are placed in a three-state condition. The outputs are automatically three-stated when a Write cycle is detected.
15, 41, 65, 91	V_{DD}	Power Supply	Power supply inputs to the core of the device. Should be connected to 3.3V power supply.

Pin Descriptions (continued)

Pin Number	Name	I/O	Description
17, 40, 67, 90	V_{SS}	Ground	Ground for the I/O circuitry of the device. Should be connected to ground of the system.
5, 10, 14, 21, 26, 55, 60, 71, 76	V_{SSQ}	Ground	Ground for the device. Should be connected to ground of the system.
4, 11, 20, 27, 54, 61, 70, 77	V_{DDQ}	I/O Power Supply	Power supply for the I/O circuitry. Should be connected to a 3.3V power supply.
1, 16, 30, 50–51, 66, 80	NC	-	No connects.
38, 39, 42, 43	DNU	-	Do not use pins. Should be left unconnected or tied LOW.

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CDV}) is 7.5 ns (117-MHz device).

The CY7C1345 supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486 processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the Processor Address Strobe ($\overline{ADSP}$) or the Controller Address Strobe ($\overline{ADSC}$). Address advancement through the burst sequence is controlled by the $\overline{ADV}$ input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the Byte Write Enable ($\overline{BWE}$) and Byte Write Select ($\overline{BW}_{[3:0]}$) inputs. A Global Write Enable ($\overline{GW}$) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous Chip Selects ($\overline{CE}_1$, CE_2, $\overline{CE}_3$) and an asynchronous Output Enable ($\overline{OE}$) provide for easy bank selection and output three-state control. $\overline{ADSP}$ is ignored if $\overline{CE}_1$ is HIGH.

Single Read Accesses

A single read access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2, and $\overline{CE}_3$ are all asserted active, and (2) $\overline{ADSP}$ or $\overline{ADSC}$ is asserted LOW (if the access is initiated by $\overline{ADSC}$, the write inputs must be deasserted during this first cycle). The address presented to the address inputs is latched into the address register and the burst counter/control logic and presented to the memory core. If the $\overline{OE}$ input is asserted LOW, the requested data will be available at the data outputs a maximum to t_{CDV} after clock rise. $\overline{ADSP}$ is ignored if $\overline{CE}_1$ is HIGH.

Single Write Accesses Initiated by $\overline{ADSP}$

This access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2, and $\overline{CE}_3$ are all asserted active, and (2) $\overline{ADSP}$ is asserted LOW. The addresses presented are loaded into the address register and the burst counter/control logic and delivered to the RAM core. The write inputs ($\overline{GW}$, $\overline{BWE}$, and $\overline{BW}_{[3:0]}$) are ignored during this first clock cycle. If the write inputs are asserted active (see Write Cycle Descriptions table for appropriate states that indicate a write) on the next clock rise, the appropriate data will be latched and written into the device. Byte writes are allowed. During byte writes, $\overline{BW}_0$ controls $DQ_{[7:0]}$, $\overline{BW}_1$ controls $DQ_{[15:8]}$, $\overline{BW}_2$ controls $DQ_{[23:16]}$, and $\overline{BW}_3$ controls $DQ_{[31:24]}$. All I/Os are three-stated during a byte write. Since this is a common I/O device, the asynchronous $\overline{OE}$ input signal must be deasserted and the I/Os must be three-stated prior to the presentation of data to $DQ_{[31:0]}$. As a safety precaution, the data lines are three-stated once a write cycle is detected, regardless of the state of $\overline{OE}$.

Single Write Accesses Initiated by $\overline{ADSC}$

This write access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2, and $\overline{CE}_3$ are all asserted active, (2) $\overline{ADSC}$ is asserted LOW, (3) $\overline{ADSP}$ is deasserted HIGH, and (4) the write input signals ($\overline{GW}$, $\overline{BWE}$, and $\overline{BW}_{[3:0]}$) indicate a write access. $\overline{ADSC}$ is ignored if $\overline{ADSP}$ is active LOW.

The addresses presented are loaded into the address register and the burst counter/control logic and delivered to the RAM core. The information presented to $DQ_{[31:0]}$ will be written into the specified address location. Byte writes are allowed. During byte writes, $\overline{BW}_0$ controls $DQ_{[7:0]}$, $\overline{BW}_1$ controls $DQ_{[15:8]}$, $\overline{BW}_2$ controls $DQ_{[23:16]}$, and $\overline{BWS}_3$ controls $DQ_{[31:24]}$. All I/Os are three-stated when a write is detected, even a byte write. Since this is a common I/O device, the asynchronous $\overline{OE}$ input signal must be deasserted and the I/Os must be three-stated prior to the presentation of data to $DQ_{[31:0]}$. As a safety precaution, the data lines are three-stated once a write cycle is detected, regardless of the state of $\overline{OE}$.

Burst Sequences

The CY7C1345 provides an on-chip 2-bit wraparound burst counter inside the SRAM. The burst counter is fed by $A_{[1:0]}$, and can follow either a linear or interleaved burst order. The burst order is determined by the state of the MODE input. A LOW on MODE will select a linear burst sequence. A HIGH on MODE will select an interleaved burst order. Leaving MODE unconnected will cause the device to default to a interleaved burst sequence.

Table 1. Counter Implementation for the Intel Pentium®/80486 Processor's Sequence

First Address	Second Address	Third Address	Fourth Address
A_{X+1}, A_X	A_{X+1}, A_X	A_{X+1}, A_X	A_{X+1}, A_X
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

Table 2. Counter Implementation for a Linear Sequence

First Address	Second Address	Third Address	Fourth Address
A_{X+1}, A_X	A_{X+1}, A_X	A_{X+1}, A_X	A_{X+1}, A_X
00	01	10	11
01	10	11	00
10	11	00	01
11	00	01	10

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ HIGH places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. $\overline{CE}_1$, CE_2, $\overline{CE}_3$, $\overline{ADSP}$, and $\overline{ADSC}$ must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW. Leaving ZZ unconnected defaults the device into an active state.

ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min.	Max.	Unit
I_{CCZZ}	Snooze mode stand-by current	$ZZ \geq V_{DD} - 0.2V$		3	ns
t_{ZZS}	Device operation to ZZ	$ZZ \geq V_{DD} - 0.2V$		$2t_{CYC}$	ns
t_{ZZREC}	ZZ recovery time	$ZZ \leq 0.2V$	$2t_{CYC}$		mA

Write Cycle, Suspend Burst	Current	H	X	X	L	X	H	H	L	X	L-H	D

Notes:

1. X="Don't Care," 1=Logic HIGH, 0=Logic LOW.
2. The SRAM always initiates a read cycle when $\overline{ADSP}$ asserted, regardless of the state of $\overline{GW}$, $\overline{BWE}$, or $\overline{BWS}_{[3:0]}$. Writes may occur only on subsequent clocks after the $\overline{ADSP}$ or with the assertion of $\overline{ADSC}$. As a result, $\overline{OE}$ must be driven HIGH prior to the start of the write cycle to allow the outputs to three-state. $\overline{OE}$ is a don't care for the remainder of the write cycle.
3. $\overline{OE}$ is asynchronous and is not sampled with the clock rise. During a read cycle DQ=High-Z when $\overline{OE}$ is inactive, and DQ=data when $\overline{OE}$ is active.

Write Cycle Descriptions[1, 2, 3, 4]

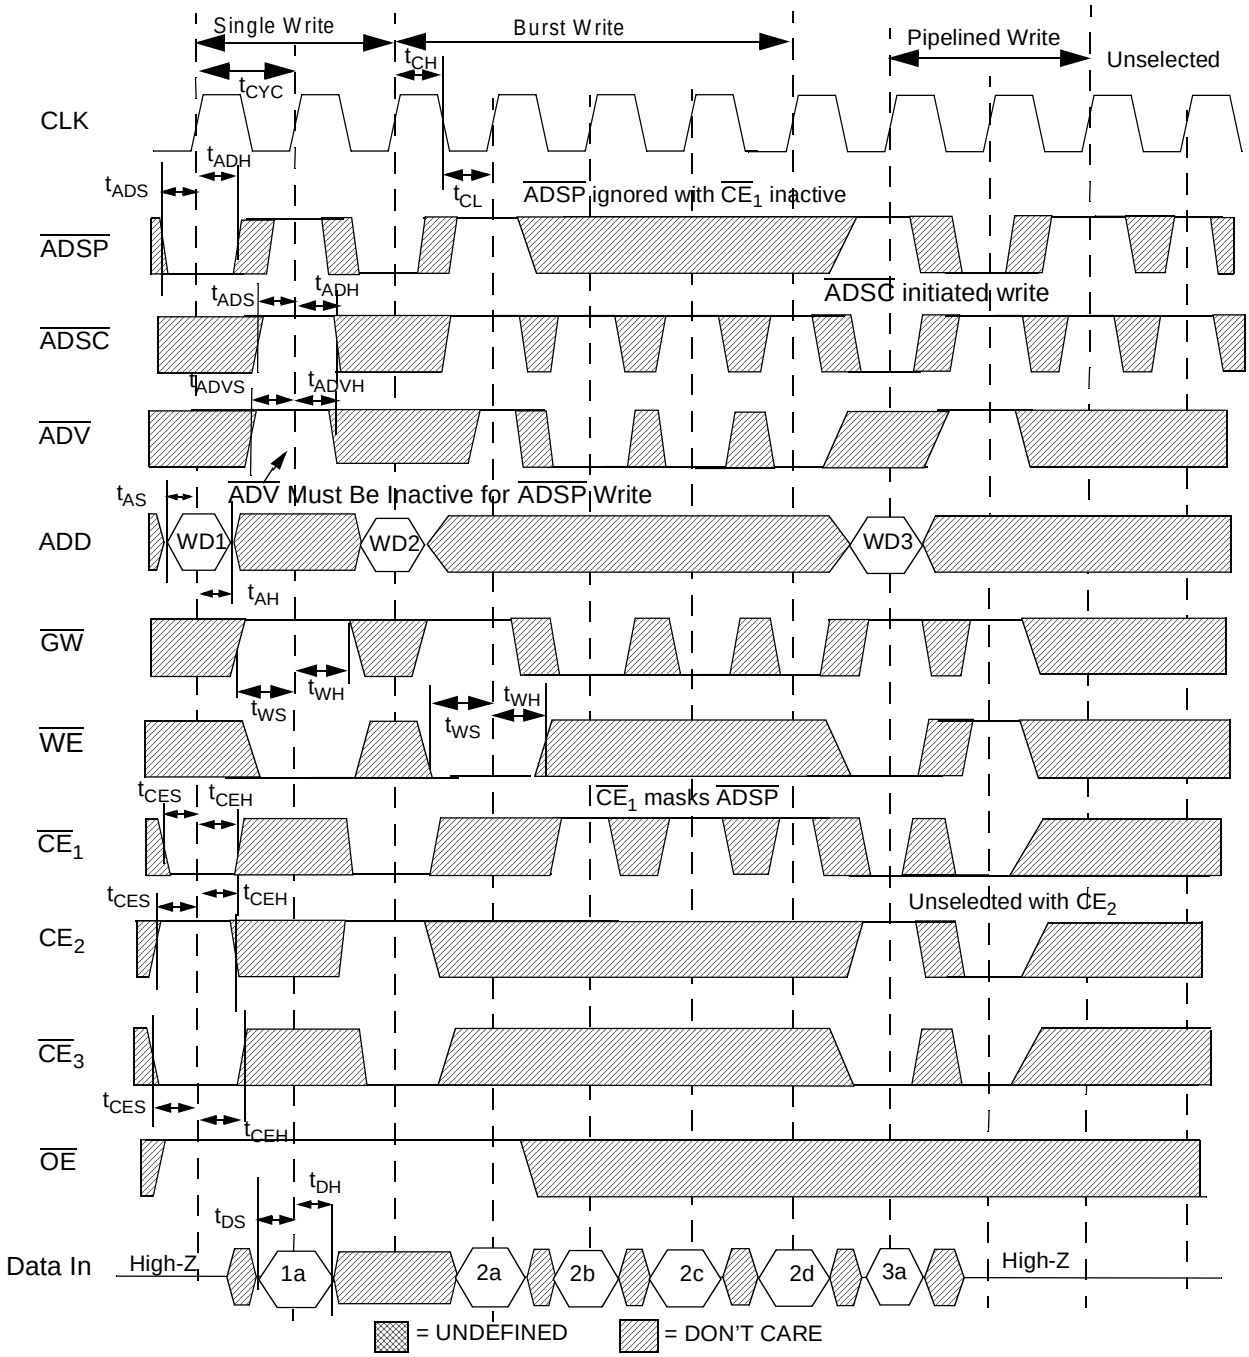
t_{CHZ}	Clock to High-Z[10, 11]		3.5		3.5		3.5		3.5	ns
t_{CLZ}	Clock to Low-Z[10, 11]	0		0		0		0		ns
t_{EOHZ}	$\overline{OE}$ HIGH to Output High-Z[10, 12]		3.5		3.5		3.5		3.5	ns
t_{EOLZ}	$\overline{OE}$ LOW to Output Low-Z[10, 12]	0		0		0		0		ns
t_{EOV}	$\overline{OE}$ LOW to Output Valid		3.5		3.5		3.5		3.5	ns

Notes:

8. Tested initially and after any design or process changes that may affect these parameters.
9. Unless otherwise noted, test conditions assume signal transition time of 2.5 ns or less, timing reference levels of 1.25V, input pulse levels of 0 to 2.5V, and output loading of the specified I_{OL}/I_{OH} and load capacitance. Shown in (a) and (b) of AC test loads.
10. t_{CHZ}, t_{CLZ}, t_{EOHZ}, and t_{EOLZ} are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
11. At any given voltage and temperature, t_{CHZ} (max) is less than t_{CLZ} (min).
12. This parameter is sampled and not 100% tested.

Timing Diagrams

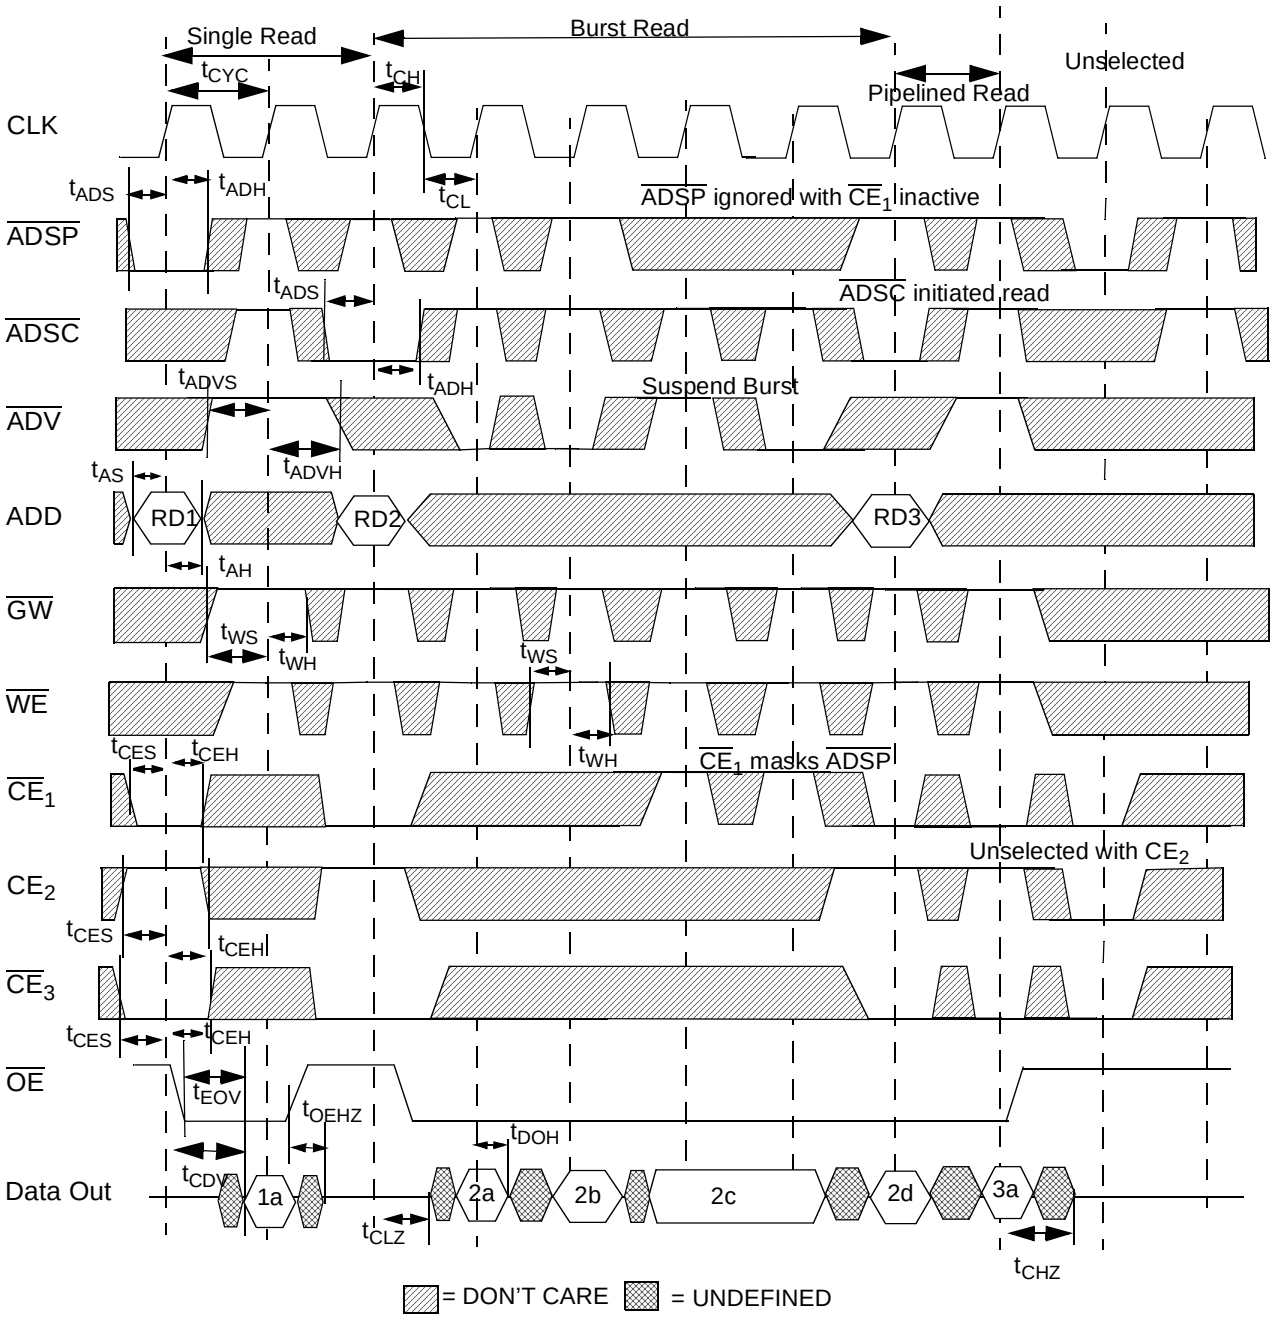
Write Cycle Timing[13, 14]



Notes:
13. $\overline{WE}$ is the combination of $\overline{BWE}$, $\overline{BW}_{[3:0]}$ and $\overline{GW}$ to define a write cycle (see Write Cycle Descriptions table).
14. WDx stands for Write Data to Address X.

Timing Diagrams (continued)

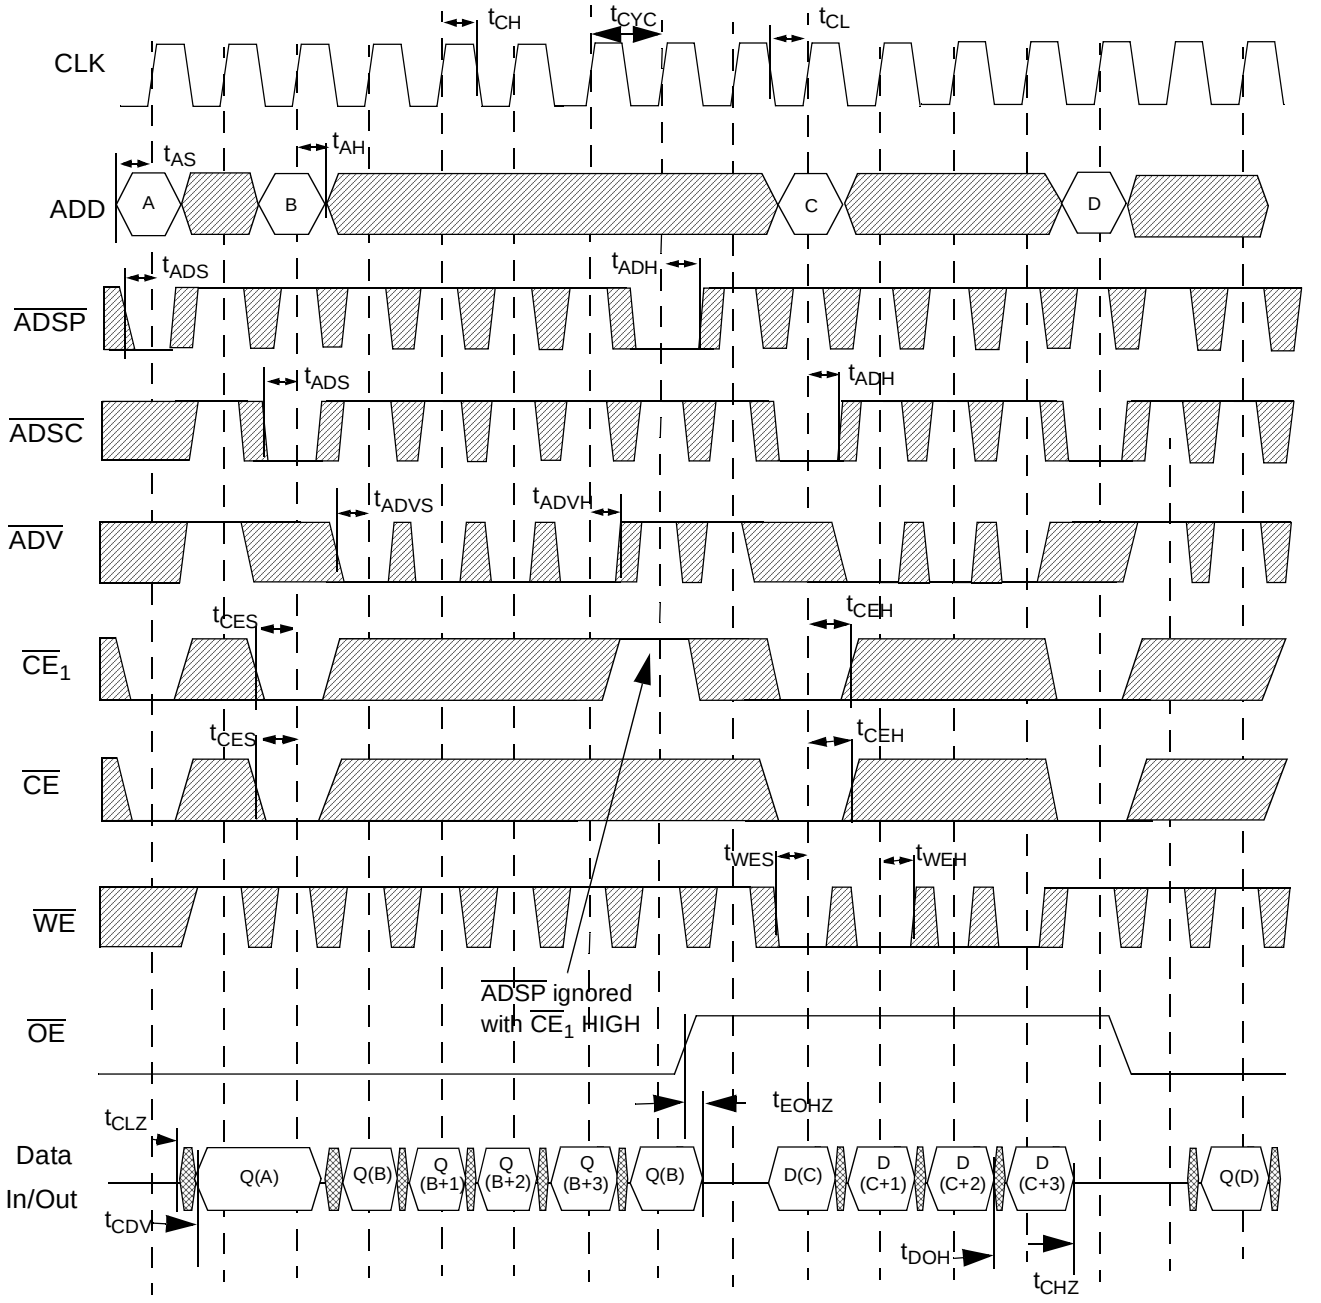
Read Cycle Timing[13, 15]



Note:
15. RDx stands for Read Data from Address X.

Timing Diagrams (continued)

Read/Write Timing



$\overline{WE}$ is the combination of $\overline{BWE}$, $\overline{BWS}_{[1:0]}$, and $\overline{GW}$ to define a write cycle (see Write Cycle Descriptions table).
$\overline{CE}$ is the combination of CE_2 and $\overline{CE}_3$. All chip selects need to be active in order to select the device. RAx stands for Read Address X, WAx stands for Write Address X, Dx stands for Data-in X, Qx stands for Data-out X.

= DON'T CARE = UNDEFINED

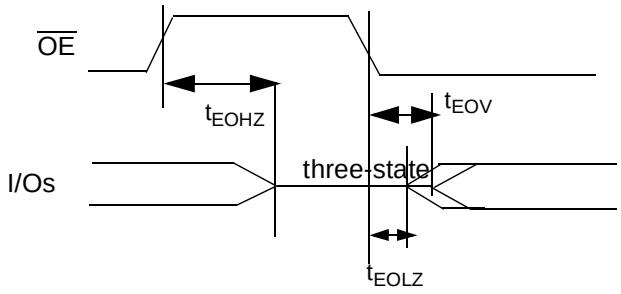
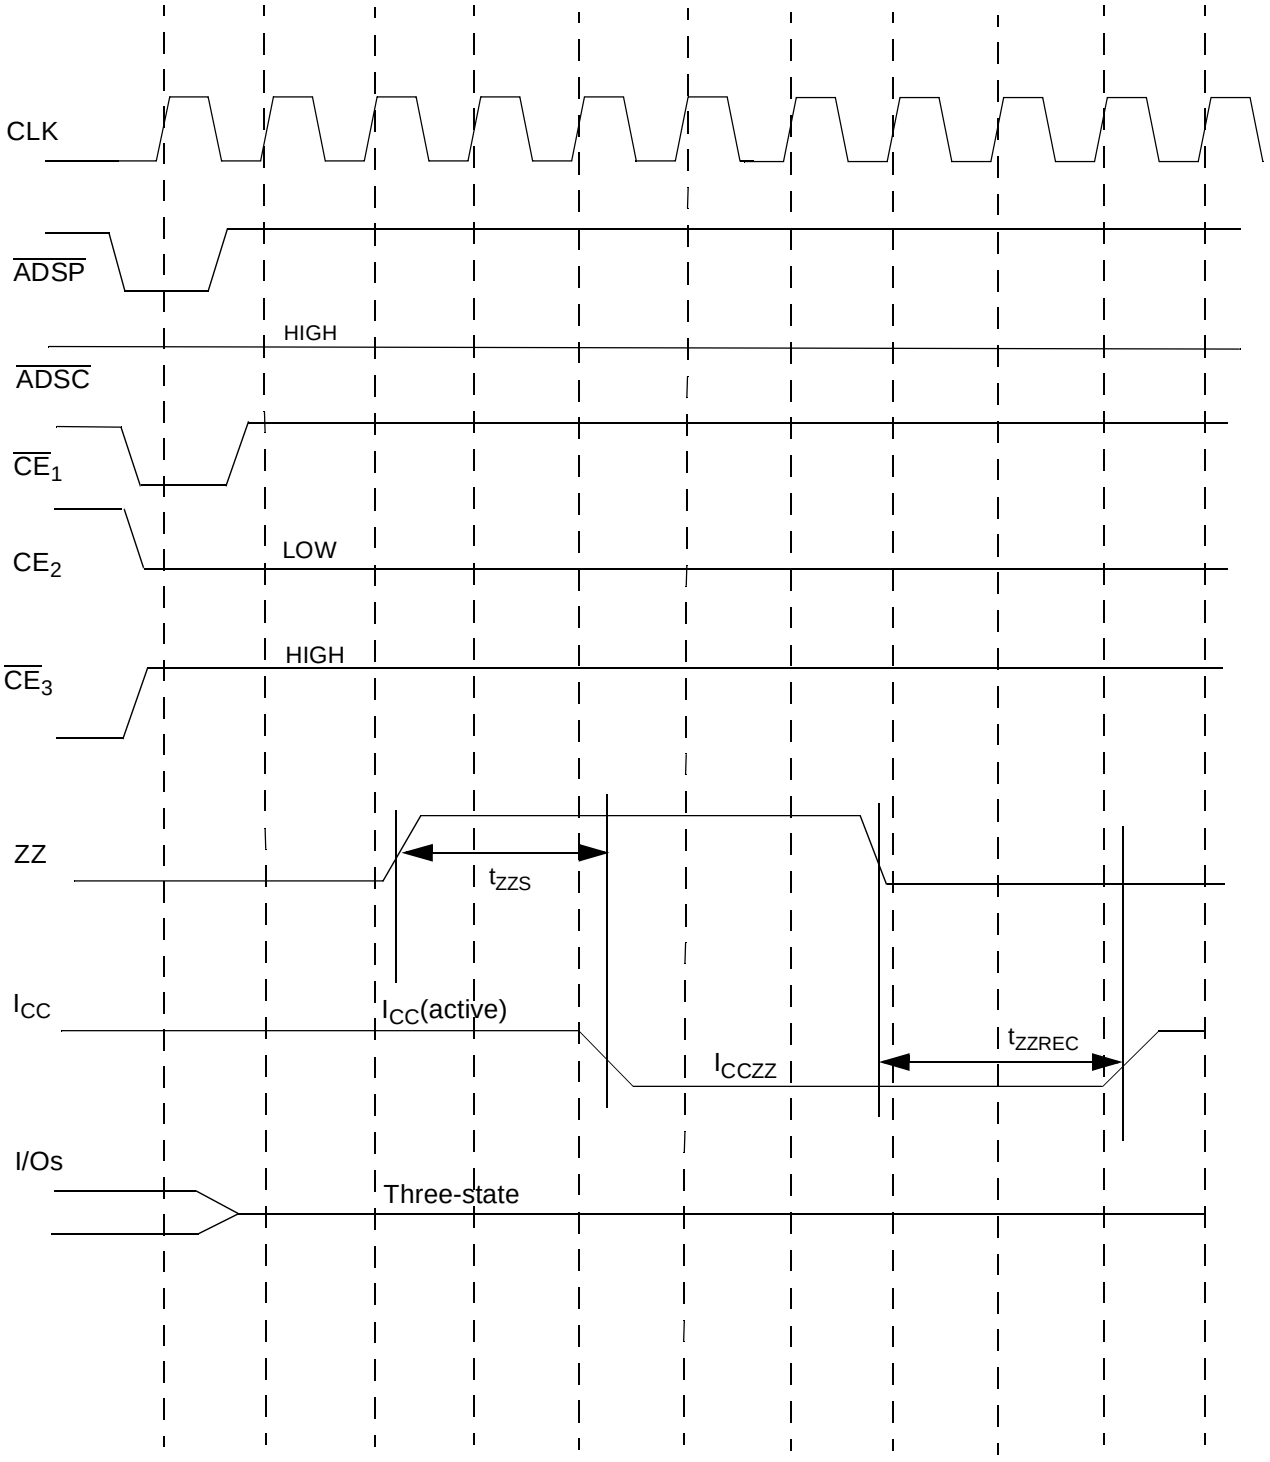
OE Switching Waveforms



Timing Diagrams (continued)

ZZ Mode Timing [16, 17]



Note:
16. Device must be deselected when entering ZZ mode. See Cycle Description Table for all possible signal conditions to deselect the device.
17. I/Os are in three-state when exiting ZZ sleep mode.

Ordering Information

Speed (MHz)	Ordering Code	Package Name	Package Type	Operating Range
117	CY7C1345–117AC	A101	100-Lead Thin Quad Flat Pack	Commercial
100	CY7C1345–100AC	A101	100-Lead Thin Quad Flat Pack	
90	CY7C1345–90AC	A101	100-Lead Thin Quad Flat Pack	
50	CY7C1345–50AC	A101	100-Lead Thin Quad Flat Pack	

Document #: 38-00725-B
