

# $\mu$ A7800 SERIES POSITIVE-VOLTAGE REGULATORS

SLVS056E – MAY 1976 – REVISED JULY 1999

- 3-Terminal Regulators
- Output Current up to 1.5 A
- Internal Thermal-Overload Protection
- High Power-Dissipation Capability
- Internal Short-Circuit Current Limiting
- Output Transistor Safe-Area Compensation
- Direct Replacements for Fairchild  $\mu$ A7800 Series

## description

This series of fixed-voltage monolithic integrated-circuit voltage regulators is designed for a wide range of applications. These applications include on-card regulation for elimination of noise and distribution problems associated with single-point regulation. Each of these regulators can deliver up to 1.5 A of output current. The internal current-limiting and thermal-shutdown features of these regulators essentially make them immune to overload. In addition to use as fixed-voltage regulators, these devices can be used with external components to obtain adjustable output voltages and currents, and also can be used as the power-pass element in precision regulators.

The  $\mu$ A7800C series is characterized for operation over the virtual junction temperature range of 0°C to 125°C.

KC PACKAGE  
(TOP VIEW)

The COMMON terminal is in electrical contact with the mounting base.

TO-220AB

KTE PACKAGE  
(TOP VIEW)

The COMMON terminal is in electrical contact with the mounting base.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## AVAILABLE OPTIONS

T <sub>J</sub>	V <sub>O(NOM)</sub> (V)	PACKAGED DEVICES		CHIP FORM (Y)
		PLASTIC FLANGE-MOUNT (KC)	HEAT-SINK MOUNTED (KTE)	
0°C to 125°C	5	μA7805CKC	μA7805CKTE	μA7805Y
	6	μA7806CKC	μA7806CKTE	μA7806Y
	8	μA7808CKC	μA7808CKTE	μA7808Y
	8.5	μA7885CKC	μA7885CKTE	μA7885Y
	10	μA7810CKC	μA7810CKTE	μA7810Y
	12	μA7812CKC	μA7812CKTE	μA7812Y
	15	μA7815CKC	μA7815CKTE	μA7815Y
	18	μA7818CKC	μA7818CKTE	μA7818Y
	24	μA7824CKC	μA7824CKTE	μA7824Y

The KTE package is only available taped and reeled. Add the suffix R to the device type (e.g., μA7805CKTER). Chip forms are tested at 25°C.

## schematic

# μA7800 SERIES POSITIVE-VOLTAGE REGULATORS

SLVS056E – MAY 1976 – REVISED JULY 1999

## absolute maximum ratings over operating temperature ranges (unless otherwise noted)†

		μA78xx	UNIT
Input voltage, $V_I$	μA7824C	40	V
	All others	35	
Virtual junction temperature range, $T_J$		0 to 150	°C
Package thermal impedance, $\theta_{JA}$ (see Notes 1 and 2)	KC package	22	°C
	KTE package	23	
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds		260	°C
Storage temperature range, $T_{stg}$		-65 to 150	°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. Maximum power dissipation is a function of  $T_J(\max)$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any allowable ambient temperature is  $P_D = (T_J(\max) - T_A)/\theta_{JA}$ . Operating at the absolute maximum  $T_J$  of 150°C can impact reliability. Due to variations in individual device electrical characteristics and thermal resistance, the built-in thermal overload protection may be activated at power levels slightly above or below the rated dissipation.
2. The package thermal impedance is calculated in accordance with JE5D 51, except for through-hole packages, which use a trace length of zero.

APPLICATION INFORMATION

Figure 1. Fixed-Output Regulator

Figure 2. Positive Regulator in Negative Configuration ( $V_I$  Must Float)

NOTE A: The following formula is used when  $V_{xx}$  is the nominal output voltage (output to common) of the fixed regulator:

$$V_O = V_{xx} + \left( \frac{V_{xx}}{R1} + I_O \right) R2$$

Figure 3. Adjustable-Output Regulator

Figure 4. Current Regulator

**APPLICATION INFORMATION**

**Figure 5. Regulated Dual Supply**

**operation with a load common to a voltage of opposite polarity**

In many cases, a regulator powers a load that is not connected to ground but, instead, is connected to a voltage source of opposite polarity (e.g., operational amplifiers, level-shifting circuits, etc.). In these cases, a clamp diode should be connected to the regulator output as shown in Figure 6. This protects the regulator from output polarity reversals during startup and short-circuit operation.

**Figure 6. Output Polarity-Reversal-Protection Circuit**

**reverse-bias protection**

Occasionally, the input voltage to the regulator can collapse faster than the output voltage. This can occur, for example, when the input supply is crowbarred during an output overvoltage condition. If the output voltage is greater than approximately 7 V, the emitter-base junction of the series-pass element (internal or external) could break down and be damaged. To prevent this, a diode shunt can be used as shown in Figure 7.

**Figure 7. Reverse-Bias-Protection Circuit**

## IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
